ECONOMIC

REPORT TO THE

GOVERNOR

STATE OF UTAH
MICHAEL O. LEAVITT, GOVERNOR

1998 ECONOMIC REPORT TO THE GOVERNOR EXCERPTS

STATE OF UTAH

MICHAEL O. LEAVITT, GOVERNOR

* Demographics *

- * **Population:** increased 2.3% from July 1, 1996 to July 1, 1997, over twice the national average.
- * **Components of Growth:** natural increase accounted for approximately two-thirds of Utah's population growth in 1997. The other third came from net in-migration.
- * **Median Age:** increased from 23 in 1980 to 27 in 1996. Utah continues to have the youngest median age in the country. The median age in the U.S. is 35.
- * **Projections:** population projected to surpass 3 million by 2015.

Total Population	2,048,753
Increase (1996 to 1997)	46,353
Percent Change (1996 to 1997)	2.3%
Births	42,398
Deaths	11,082
Net Migration	15,037

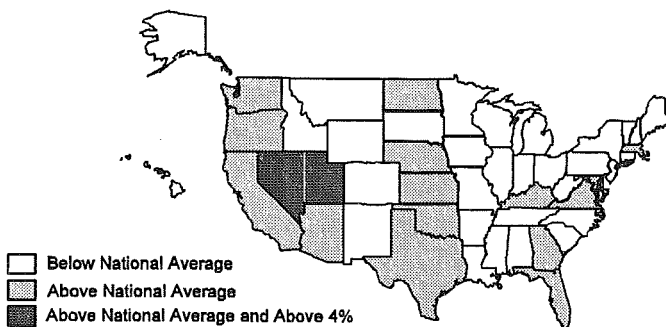

Source: Utah Population Estimates Committee and Utah Bureau of Health Statistics.

* Employment *

- * **Job Growth Rate:** equaled or exceeded 3.0% for ten consecutive years. Job growth rates peaked, however, in 1994.
- * **Construction Jobs:** increased by 8.5%, outpacing the rate of job growth in all other industries for the 7th consecutive year.
- * **Unemployment Rate:** 3.2%, the lowest rate in 45 years.

Total Nonagricultural Employment	996,500
Increase (1996-1997)	42,000
Percent Change (1996-1997)	4.4%
Unemployment Rate	3.2%

Percent Change in Employment by State
National Average = 2.3%

Source: Regional Financial Review, November 1997

Utah Job Growth Rates by Industry: 1996 to 1997

*Finance, Insurance and Real Estate
 **Transportation, Communications, and Utilities
 Source: Economic Coordinating Committee

❄ Wages and Income ❄

- ❄ **Average Wage Per Job:** increased faster than the rate of inflation for the third straight year.
- ❄ **Per Capita Income:** increased relative to the nation for the eighth consecutive year. Utah's ranking among states has now moved to 44th from 49th.

Total Nonagricultural Wages	\$25.1 billion
Percent Change (1996 to 1997)	8.7%
Average Wage Per Job	\$25,190
Percent Change (1996 to 1997)	4.1%
Total Personal Income	\$42.5 billion
Percent Change (1996 to 1997)	8.3%
Per Capita Personal Income	\$20,739
Per Capita as a % of the Nation	81.0%

Utah Per Capita Income as a Percent of U.S.

Source: U.S. Department of Commerce, Bureau of Economic Analysis and Governor's Office of Planning and Budget

❄ Major Findings ❄

- ❄ **Economic Expansion:** Utah enters 1998 with the longest sustained economic expansion in modern economic history.
- ❄ **Economic Activity Peaked:** Growth rates in jobs and housing prices peaked in 1994; growth rates in personal income and wages peaked in 1995; and home sales and construction peaked in 1996.
- ❄ **Merchandise Exports:** \$3.5 billion total, with largest markets in eastern Asia, Canada and Europe.
- ❄ **High Technology Sector:** includes 460 companies which employ approximately 40,000 workers.
- ❄ **Federal Defense-Related Spending:** totaled \$1.3 billion in 1996, down 9% since 1995.
- ❄ **Highways:** state investment will top \$3.6 billion over the next decade.
- ❄ **Construction Activity:** eighth consecutive year of boom. Nonresidential values reached new high, while residential values declined in 1997.

Preface

The *Economic Report to the Governor*, published annually since 1986, is the principal source for data, research, and analysis about the Utah economy. The report includes a national and state economic outlook, a summary of state government economic development activities, an analysis of economic activity based on the standard indicators, and a more detailed review of industries and issues of particular interest. The primary goal of the report is to improve understanding of the Utah economy. With an improved economic literacy, decision makers in the public and private sector will then be able to plan, budget, and make policy with an awareness of how their actions are both influenced by and impact economic activity.

State Economic Coordinating Committee. The State Economic Coordinating Committee (ECC) provides guidance for the contents of this report. The ECC is an advisory committee to the Governor and includes representatives from a variety of state and local government agencies, First Security Bank, Key Bank, Utah Foundation, University of Utah, Utah State University, Weber State University, and Brigham Young University. The mission of the ECC is to provide information and analysis that enhances economic decision-making in Utah. This report is the primary means of the ECC to communicate economic information to the general public.

Collaborative Effort/Contributors. This report would not be possible without the participation of over 20 different authors from 11 different public and private entities. Each of the contributors devotes a significant amount of time during the very busiest season of the year to make sure that this report has the very latest economic and demographic information included. While this report is a collaborative effort which results in a consensus forecast for next year, each chapter is the work of the contributing organization with review and comment by the Governor's Office of Planning and Budget. More detailed information about the findings in each chapter can be obtained by contacting the authoring entity (see Contributors list).

Statistics Used in This Report. The statistical contents of this report are from a multitude of

sources which are listed at the bottom of each Table and Figure. Statistics are generally for the most recent year or period available as of mid-December 1997. Since there is a quarter or more of lag time before economic data become final, the data for 1997 are preliminary estimates. Final estimates can be obtained later in 1998 from the contributing entities. All of the data in this report are subject to error arising from a variety of factors, including sampling variability, reporting errors, incomplete coverage, non-response, imputations, and processing error. If there are questions about the sources, limitations, and appropriate use of the data included in this report, the relevant entity should be contacted.

Statistics for States and Counties. This report focuses on the state, multi-county, and county geographic level. Additional data at the metropolitan, city, and other sub-county level may be available. For information about data for a different level of geography than shown in this report, the contributing entity should be contacted.

New This Year. While the content of this report, other than introducing a new year of data and analysis, is similar to prior years, several new data series or research efforts are worthy of highlighting. Economic issues associated with the reconstruction of I-15 and information about transportation funding in general, is included. Another chapter in the Special Topics section explores growth in state government.

Electronic Access. This report is available on the Governor's Office of Planning and Budget's Internet homepage at <http://www.governor.state.ut.us/dea>.

Suggestions and Comments. Users of the *Economic Report to the Governor* are encouraged to write or call with suggestions that will improve future editions. Suggestions and comments for improving the coverage and presentation of data and quality of research and analysis should be sent to the Governor's Office of Planning and Budget, 116 State Capitol, Salt Lake City, Utah, 84114. The telephone number is (801) 538-1036. *

MICHAEL O. LEAVITT
GOVERNOR

STATE OF UTAH
OFFICE OF THE GOVERNOR
SALT LAKE CITY
84114-0601

OLENE S. WALKER
LIEUTENANT GOVERNOR

January 6, 1998

My Fellow Utahns:

It is an honor to accept the 1998 *Economic Report to the Governor*. The Economic Coordinating Committee has once again prepared a careful and thoughtful assessment of Utah's economic performance. I am pleased that decision makers have access to a report that has earned a reputation as the premier source for data, research and analysis about Utah's economy.

Utah begins 1998 with population and job growth rates that are twice the national average. As we prepare for the new century and millennium, there is no question that Utah is very well positioned economically. We are currently experiencing the longest sustained economic expansion in modern Utah's economic history. When I first took office, I pledged that we would take this state to a new level of performance. The significant and prolonged economic achievements characterized in this year's *Economic Report* are evidence of the progress that has been made. I thank all Utahns for your collective contributions that have placed us in this optimal position.

In addition to characterizing the achievements of Utah's economy as significant, strong and sustained, this year's *Economic Report* confirms that Utah is returning to more typical levels of economic activity. We find ourselves at a pivotal moment where we must transition the state's economy back to more normal levels of growth. Many present and future economic challenges are part of this transition. We must maintain the viability of Hill Air Force Base, one of our state's largest employers. We must train our workforce for the jobs of the future. And, we must preserve our quality of life.

The analysis presented in this year's *Economic Report* will help us position ourselves for the 21st Century. I thank you for the opportunity to be in public service and I ask that you join me in meeting the challenges of the present and future.

Sincerely,

Michael O. Leavitt
Governor

Summary

Executive Summary

In the past two years, Utahns have commemorated two important historical events: Utah's statehood centennial and the sesquicentennial anniversary of the arrival of the Mormon pioneers into the Salt Lake Valley. Both have occurred during phenomenally prosperous times in Utah. *Utah enters 1998 with the longest sustained economic expansion in modern economic history and continues to record population and job growth rates that are twice the national average.* The current prosperity can be characterized as significant and prolonged. Utah's job growth rate of 4.4% ranked second in the nation in 1997 and has now met or exceeded 3.0% for ten consecutive years. The unemployment rate of 3.2% is the lowest in 45 years. Utah's per capita income rankings have moved from 49th lowest among states to 44th during this expansion and wage growth rates have exceeded the rate of inflation now for three consecutive years.

Because of these significant economic achievements, economists have characterized Utah's economic performance throughout this year's *Economic Report* as significant, strong and sustained. There is no question that 1997 was a successful year for Utah's economy and that the state is well positioned as the 21st Century approaches.

This year's 1998 *Economic Report to the Governor*, however, introduces and elaborates on a second and new theme. This theme is a *general slowdown in economic activity that is now confirmed by as much as three years of economic data.* Many of the forecasts in past *Economic Reports* of a "cooling down" are now coming true as the Utah economy returns to more typical levels of activity. It now

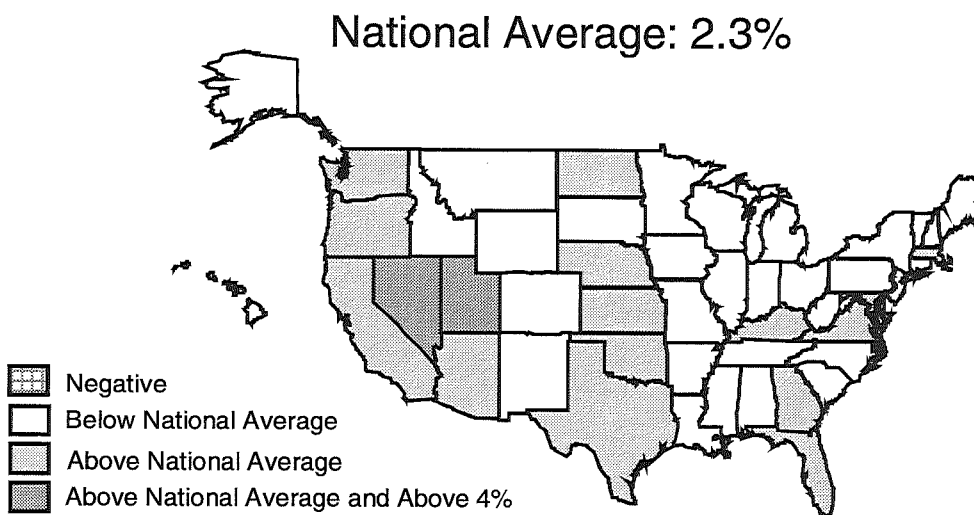

appears that the economic expansion has peaked. Growth rates in jobs and housing prices peaked in 1994; growth rates in personal income and wages peaked in 1995; and, home sales and residential construction peaked in 1996.

The 1998 *Economic Report to the Governor* conveys these two contrasting themes of a successful economy and an economy that is decelerating by examining current and historical data. A forecast of the near and long-term future is also presented. The interplay of these divergent themes is highlighted throughout the report by an economy that is:

- ✧ Complemented by national and regional economic conditions;
- ✧ Sustained by construction activity, particularly nonresidential (hotels, office buildings, etc.), freeway, pre-Olympic, and light rail construction;
- ✧ Supported by plentiful job and higher income opportunities;
- ✧ Bolstered by a diversity of industries, including contributions from the tourism, high technology, nonprofit, and manufacturing industries;
- ✧ Past the peak, as job creation, gross taxable sales, tax collections, housing price appreciation, and residential construction have slowed;
- ✧ Tempered by a global economy that has been impacted by the Asian Economic Crisis; and,
- ✧ Challenged by ongoing issues regarding Hill Air Force Base, transportation funding, availability of labor, and quality growth.

Each of these themes is described in more detail, followed by a consensus outlook for 1998 and beyond.

Figure A
Percent Change in Employment by State 1997

Source: Regional Financial Review, November 1997

Complemented by National and Regional Economic Conditions

The United States is in its seventh year of economic expansion, posting real gross domestic product growth of 3.8% in 1997. Unemployment of 4.6% in December 1997 is at a 25-year low and consumer price inflation for all of 1997 of 2.4% is an 11-year low. The federal government has made huge strides in taming the federal deficit and the Tax Relief Act of 1997 will provide tax cuts in coming years. These national economic successes are broadly distributed among states; nearly two-thirds of the nation's 300 plus metropolitan areas have unemployment rates below 5 percent. California has now reclaimed its position as an economic leader by posting job growth rates higher than the national average.

The Mountain Division continues to lead all regions in economic vitality and growth and is in the midst of a five year economic boom. Every state in the Mountain Division but Wyoming posted personal income growth greater than the national average during this period. Clearly, Utah's current economic prosperity is complemented and impacted by a national and regional economy that is strong.

Sustained by Construction Activity

Construction activity continues to be the major driving force

sustaining Utah's economic expansion. It is the fastest growing industry in the Utah economy and has been for seven years running. Nonresidential construction reached a record high of \$1.07 billion in 1997. Very large projects such as the \$1.6 billion reconstruction of I-15, the \$312 million TRAX (light rail) project; \$240 million Church of Jesus Christ of Latter Day Saint assembly hall; and \$185 million Little America Hotel bolster the current boom which has now lasted for eight years. The rebuilding of I-15 alone in its peak will employ 3,000 persons working two 10-hour shifts. TRAX also should directly employ around 400 workers at its peak.

Supported by Job Creation and Higher Incomes

Utah posted the second fastest job growth rate of any state in 1997. Construction, mining, and services all registered job growth rates higher than the state average of 4.4% for all jobs. Federal government was the only industry to lose jobs in 1997. These rapid rates of job growth have resulted in unemployment levels in 1997 of 3.2%, a 45-year low.

Job creation has now contributed to seven consecutive years of net in-migration. Utah's 1997 population is estimated at 2.05 million, a 2.3% growth rate from 1996. Over two-thirds of this growth was indigenous, as Utahns continue to have the highest fertility rate in the country.

Figure B
Value of New Construction: 1970 to 1997

Source: University of Utah, Bureau of Economic and Business Research.

Employers are reacting to a fully employed economy by paying Utah workers more. Utah's per capita income rankings have increased steadily for the past four years. Furthermore, the wages of Utah workers are rising faster than inflation and faster than the national average. Average pay in Utah increased by 4.0% in 1996, compared to a 3.0% rise in consumer prices and a 3.9% increase in pay nationwide. Median household income in Utah of \$37,038 now ranks 17th in the nation and is over \$1,500 higher than the national average.

Disposable income is also higher because of reductions in many taxes during the past four years. The cumulative reduction in state tax collections from fiscal year 1995 through 1999 is approximately \$769 million. In future years, the federal Taxpayer Relief Act of 1997 will provide federal tax cuts of about \$958 over five years for each Utah tax filer.

Benefitted by a Diversity of Industries

The structure of Utah's economy continues to diversify relative to the nation. A more diverse economy means that it is less specialized and therefore less vulnerable to changes impacting any one industry. Utah's current level of economic diversity is the result of the simultaneous occurrence over time of the: (1) restructuring of the mining and metals industries; (2) downsizing of the federal government; and, (3) emergence and growth of service industries, tourism-related industries, and particular types of manufacturing. In mining and federal government, two areas where Utah has historically been quite specialized relative to the nation, employment levels have decreased over time. Federal government employment in Utah has declined for seven consecutive years resulting in nearly 9,500 fewer federal workers. Mining jobs in Utah surpassed the 20,000 level in 1981, but totaled only 8,300 in 1997.

While mining and federal government have contracted other industries have emerged. Utah's high technology industry now includes more than 460 companies and a workforce of approximately 40,000. Major sectors include aerospace components, automotive products, biomedical and medical products, and software systems. Utah's tourism industry has also grown. In 1997, out-of-state visitors made 17 million trips to Utah. These visitors spent an estimated \$4.0 billion in the Utah economy. Skier visits reached 3 million in 1997, the second best year ever. Even Utah's nonprofit sector contributes to Utah's economic base and diversity.¹ Approximately one-third of the nonprofit sector's revenue sources come from out-of-state sources. Purchases by the nonprofit sector in 1996 generated \$380 million in earnings in Utah and nearly 16,000 jobs. And in manufacturing, Utah's automotive products sector employs approximately 6,100, an increase of 5,400 jobs in five years. These industries have been instrumental in making Utah's economy less vulnerable to fluctuations in any one industry and have helped make the

¹ The nonprofit sector here refers to Internal Revenue Service 501(c)(3) organizations.

current expansion the longest in recent history.

Past the Peak

A general slowdown in economic activity is evidenced by lower rates of growth in jobs, gross taxable sales, and tax collections; a decline in residential construction value and in home sales; and a slowdown in housing price appreciation. Employment growth slowed again in 1997 for the third consecutive year. This slowdown has now occurred for 11 consecutive quarters. Gross taxable sales in 1997 increased by 4.4%, the lowest rate of increase in ten years. The rate of growth in tax collections-- after adjusting for inflation and rate and base changes-- declined for the second year in a row. While nonresidential construction experienced a record year, residential construction values declined nearly 10% in 1997. This decline is related to a decline in home sales that occurred in every quarter since the end of 1996. The housing market also reached a turning point. The growth rate in housing prices peaked in mid-1994 and has declined ever since. These signs indicate a return to more typical rates of economic growth.

Tempered by Global Economy

Growth in the global economy in recent years has been driven by the United States and Pacific Rim countries. The current turmoil in Asian financial markets adds considerable instability to present and future performance of selected aspects of the U.S. and Utah economy. Multinational corporations face the prospect of lower earnings from Asian markets, as well as increased competition from anxious Asian competitors. Utah's export industry is at risk since Utah ranks 7th among states in per capita exports to Asia and about 40% of Utah's total exports go to Asia. While Utah's export industry has made phenomenal gains by increasing from \$943 million in 1988 to an estimated \$3.5 billion in 1997, exports have now declined for two consecutive years. Copper is Utah's number one export and Asia is the number one customer. The Asian economic crisis adds the potential for the dumping of chips, automobiles, and electronics into the U.S. market, further aggravating Utah's export industry. On the positive side, consumers may benefit from lower interest rates and lower prices. However, a major player in the global economy is struggling and the economies of both the nation and Utah have and will continue to be impacted.

Challenged by Ongoing Issues

The Utah economy continues to face several challenges, some of which have the potential to impact economic activity significantly. Five key challenges are the continuing scrutiny of Hill Air Force Base, the funding for the I-15 rebuilding project, availability of labor, and preserving Utah's enviable quality of life.

Hill Air Force Base. Although President Clinton signed a defense bill that eliminates preferential treatment in the bidding process for competing repair-and-maintenance facilities, the Department of Defense is currently

considering the future of the 388th Fighter Wing at Hill Air Force Base. The 388th comprises 2,000 jobs and its presence is vital to the long term viability of Hill. Hill is currently operating at around 50% capacity and the transfer of the 388th would leave Hill extremely vulnerable to future rounds of base closings. The Pentagon has announced that it may decide the future of the 388th as soon as January 1998.

Transportation Funding. The rebuilding of I-15 is currently the largest public works project in North America. The funding of this construction has enormous implications on the economy because of the importance of the source and timing of these funds. I-15 was originally budgeted for \$1.36 billion. However, the total cost is now \$230 million higher because of enhancements and other changes to the building program. This problem is further impacted by the fact that the contractor is ahead of schedule. This causes cash flow problems. In addition, several of the original funding sources are unpredictable (e.g. federal funds). State government will need to increase bonding, raise transportation taxes and fees, allocate more general fund to monies to transportation; eliminate or delay projects; or a combination of these alternatives in order to pay for the reconstruction. Each of these alternatives introduces different impacts on economic activity and the prospects for future growth.

Availability of Labor. The availability of labor is always a concern in a rapidly growing economy. Several indicators point to an emerging labor shortage in Utah. Non-agricultural employment in Utah has been growing an average of 4.4% over the last ten years, while unemployment rates have plummeted from 6.4% in 1987 to 3.2% today. Salt Lake City's Help Wanted Index has been the highest in the nation for four consecutive years and wages have been rising at about 3.5% a year since 1991. Employers speak of shortages of highly technical computer specialists, telemarketing workers, retail sales workers, and certain construction occupations. State and local government are striving to help with labor availability concerns by: attracting companies that further diversify the economy; increasing the skill level of workers; and coordinating the training of workers with the needs of businesses.

Quality Growth. Urban growth is an issue of concern to many Utahns. A recently compiled baseline scenario prepared by state and local government demonstrated the problem of rapid and sprawling growth in the Greater Wasatch Area¹ by revealing several sobering statistics for the year 2020:

- ✧ A population that would reach 2.7 million, the current

size of the San Diego metro area

- ✧ A transportation system that will on average have longer commute times, lower speeds and increased congestion, despite significant investments in light rail and reconstruction of a major federal interstate
- ✧ Increases in every major air pollutant, despite 25 years of improving air quality in the region
- ✧ The loss of 66,000 acres of irrigated agricultural lands to accommodate urban growth
- ✧ A water and transportation infrastructure price tag of \$12.9 billion²

Envision Utah is a public-private partnership devoted to the development of a publicly supported growth strategy that will preserve Utah's quality of life and economic vitality during the next 50 years. It is guided by over a 100 community leaders who will develop and share information with the public about alternative future growth scenarios. Residents will be given the opportunity to comment on these scenarios and have a voice on how the future unfolds.

Outlook

Near Term. The Economic Coordinating Committee's consensus forecast calls for a continued slowing of economic growth in 1998 from the peak years in 1994-95. Job growth next year is expected to hover around the long term historical average of 3.6 percent. This rate of growth is still nearly double the forecasted national rate and would be the eleventh consecutive year of job growth higher than 3.0% in Utah. Growth in population; levels of net migration; changes in personal income and wages; and the value of construction are forecast to decline in 1998.

The primary causes for slower growth are 1) a tighter labor market; 2) slower growth in exports; and, 3) improvements in other state economies, particularly California. The major risk is the future of the 388th Fighter Wing at Hill Air Force Base. The Secretary of Defense and the Air Force are currently considering whether to keep the 388th in Utah or move it out-of-state. Even with the anticipated return to more normal rates of growth, 1998 should add another year to Utah's current run of prosperity and position the state well economically to enter the 21st Century.

Long Term. Utah's population is projected to reach 3.3 million by the year 2020, a 2.1% annual average rate of growth since 1995. This rate of growth will be sustained by a rapid rate of natural increase (births exceeding deaths) and a strong and diversified economy. The most rapid rates of growth are expected in southwest Utah and Grand, Summit, and Wasatch Counties. Employment and population growth statewide is projected to exceed the national average. ✧

Economic

Outlook

National Outlook

Overview

The national economy continued in its seventh year of expansion. This robust economy, characterized by low unemployment and inflation rates, is expected to continue through 1998, barring any negative impacts from shaky international financial markets. Inflation should remain at around 2.2% in 1998, with unemployment rates hovering around the 4.6% range. The "wild card" in forecasting U.S. economic performance is uncertainty in Asian financial markets, which could potentially lower inflation and interest rates in the U.S.

1997 Summary

The U.S. economy keeps chugging along in its seventh year of expansion. Early in 1997, the Federal Reserve put a temporary end to the "irrational exuberance" of the U.S. stock market by increasing the federal funds by .25%. However, after an approximate 10% correction in various stock market indices during the spring, the U.S. stock market went on to set record highs in the summer and fall. Despite the early attempt by the Federal Reserve to tighten monetary policy, further tightening moves proved unnecessary as inflation remained subdued. Thoughts of another tightening in the fall were put off due, in part, to the turmoil in the Asian financial markets. The strengthening of the U.S. dollar, the flight of international funds to the "safe haven" of the U.S. bond market, and the potential of worldwide supply being greater than demand, made further monetary tightening unnecessary.

Signs of the U.S. economy's continued expansion were witnessed in strong job creation. The U.S. unemployment rate stood at 4.6% in December, a 25-year low. With the economy experiencing "full employment," consumers also did their part in helping push the economy along by increasing inflation-adjusted spending by over 3% in 1997. Business investment was also an important factor in economic growth. For example, growth in inflation-adjusted investment in durable equipment rose 13.3% in 1997.

Overall 1997 was a good year for the economy with inflation-adjusted gross domestic product increasing by 3.8% and inflation, as measured by the consumer price index (CPI), registering only a 2.4% increase. U.S. residential and commercial construction were up during the year, while corporate profits (before taxes) increased 8%.

1998 Outlook

The longer this expansion lasts, the greater the potential for a recessionary period. However, it appears that 1998 will bring more of the same, that is, continued expansion of about 2.5% in inflation-adjusted gross domestic product and continued subdued inflation of about 2.2% as measured by the consumer price index.

The Federal Reserve will be closely monitoring the economy for signs of increasing inflation. If the Federal Reserve notices increasing inflationary pressures, a monetary policy tightening move is likely. Federal Reserve Chairman Alan Greenspan clearly sees price stability as a key role for any central bank.

U.S. employment should continue to hover around the 4.6% rate seen in November of 1997. So it appears that employers will continue to have a challenge in competing for the supply of workers. This high level of employment should allow consumers to increase inflation-adjusted consumption by about 3% in 1998.

Significant Issues

Asia—A Wild Card. Probably the most difficult thing to measure regarding the 1998 economic performance is the current turmoil in Asian financial markets. We truly exist in an international economy and even the enormous U.S. economy will be impacted by the problems in Asia. The questions are: What will the impact be? and, How significant will the impact be? Multinational corporations face the prospect of lower earnings from Asian markets as well as increased price competition from anxious Asian competitors. This earnings related scenario is already taking a toll on stock prices of U.S. companies doing business in Asia. Much of the downturn in U.S. stock market that occurred in late October was a result of the Asian financial unrest.

The most likely results of this financial unrest, which in some cases are already occurring, include: lower interest rates, lower inflation, and less growth in the U.S. economy. Weaker growth in Asia and a stronger U.S. dollar will lead to: 1) reduced demand for U.S. exports, and 2) an increase of imported goods as U.S. consumers and businesses substitute imports for domestically produced goods.

Year 2000 Computer Problem. The year 2000 computer problem may become an important issue for the U.S. economy. As companies work toward fixing software programs, expect the salaries of computer programmers to increase. Given these rising wage costs, and because there is no increase in productivity or output from fixing a computer bug, downward pressure on corporate profits is possible. It is difficult to know if the year 2000 computer problem can have a larger recessionary impact on the economy. The negative impact could come as early as 1999 if consumers and investors perceive that business and government are not taking the problem seriously. Think what would happen if in January 2000 consumers received bills on credit cards, or other installment loans, with interest and penalties calculated from 1900. This is in essence the year 2000 computer problem. Current computer programs will interpret the year 2000 as being 1900.

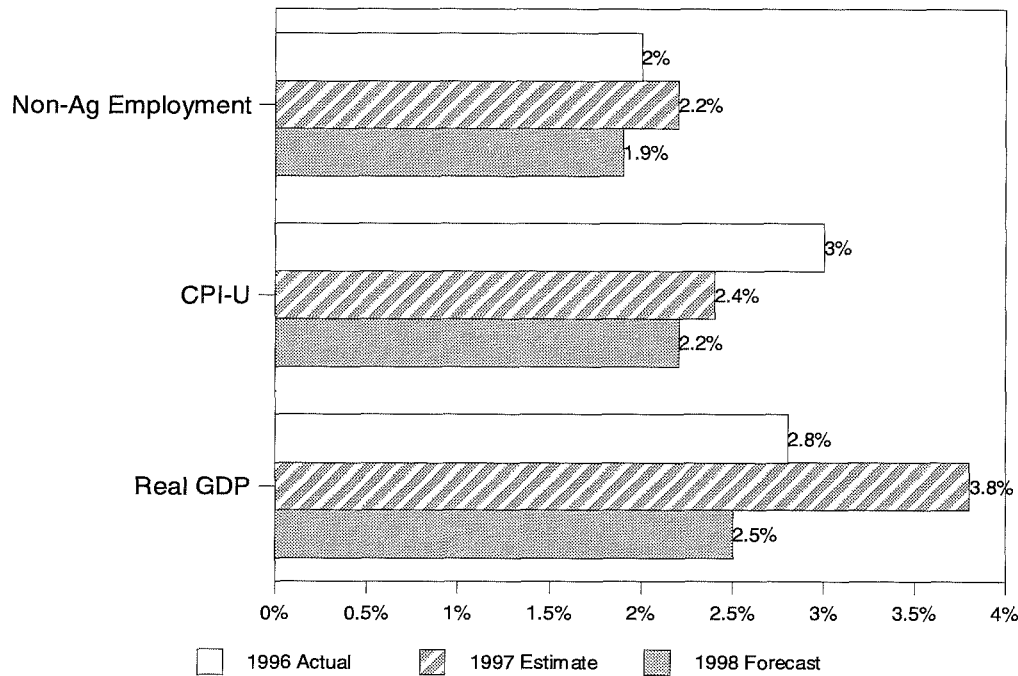

Conclusion

The seven year U.S. economic expansion should continue into 1998. To continue to expand, the U.S. economy has some hurdles to clear. The Asian financial turmoil will put downward pressure on economic growth as will domestic issues such as the year 2000 computer problem. Corporate profits will grow slowly and this should result in lower stock market returns than have been experienced in the last few

years. Interest rates and inflation should continue to be relatively low which should be positive for U.S. financial markets. The Federal Reserve will raise short term rates if inflation surprises on the upside, but such a move is probably six months away. Overall, the U.S. economy is providing the best of "both worlds" – economic growth with low inflation. ❄

Overview

The Utah economy continues to be strong with a job growth rate of 4.4% and unemployment of 3.2% in 1997.

Construction continues to lead all other industries in the rate of growth. Nonresidential construction reached a historic high in 1997 and should continue at record levels in 1998. Employment growth rates and other economic indicators are moderating, however, and the economy appears to be heading towards more typical rates of growth. The growth rate in jobs and housing prices peaked in 1994 and the growth rate in personal income and wages peaked in 1995. Home sales and residential construction declined in 1997. The outlook remains positive, but the economy is expected to slow in 1998. Employment is forecasted to increase by 3.6% in 1998; population, 2.0%; and personal income, 7.9%.

1997 Summary

Employment and Unemployment. Utah's nonfarm job growth continues to moderate after peaking in 1994. Still, annual growth in employment remains above its long-term (1950-96) historic average of 3.6%. Job growth in Utah has slowed for each of the last 11 quarters of available data. The rolling-year (annual, 4 quarter moving average) job growth rate peaked at 6.2% in the 3rd quarter of 1994, and has declined each quarter thereafter to 4.7% in the 2nd quarter of 1997. The Bureau of Labor Statistics (BLS) recently reported that job growth in Utah was 4.1% for October 1997 compared to the same month in 1996; for an increase of 40,000 jobs. The October BLS data showed that construction had the highest year-over growth rate at 9.1%; whereas, services at 5.9% added that most jobs to the economy (15,500).

The BLS data showed that the unemployment rate in Utah was 3.0% for October 1997. By comparison, the national unemployment rate for October 1997 was 4.4%. Utah placed 2nd (behind Nevada) in the nation in total nonagricultural employment growth, and 1st in the U.S. in services employment for September 1997 over September 1996. Total employment growth in Utah should average about 4.4% in 1997 and then decline to 3.6% in 1998.

Total nonagricultural employment in Utah grew 5.1% in 1996. This was moderately lower than the 5.6% of 1995. Most of the growth in 1996 came from the private-sector at 5.8%, compared to 1.7% for the public-sector. Employment growth slowed slightly in 1997 to 4.4% with private-sector growth of 4.8% and government growth of 2.6%. The unemployment rate declined from 3.6% in 1995 to 3.5% in 1996, and then to 3.2% in 1997.

Industries with growth rates above the 4.4% average for

1997 include construction at 8.5%, mining at 4.7%, and services at 6.3%. All other industries grew below the 4.4% rate. Only federal government employment showed losses in employment at -0.8%.

New Firm Openings and Expansions. New firm openings and major expansions of existing firms with 100 or more workers in 1997 included, but were not limited to: TheraTech Inc., American Pacific Corp., Smithfield Foods, Alliant Techsystems, Prime Option Mastercard, Smead Manufacturing, Detroit Diesel, ZM Direct, Matrixx Marketing, Paunsaugant Energy Corp., Software Support Inc., Panel Prints, Interim Technology, Intel, Southwest Airlines, Wasatch Technologies, Megahertz, CR England, Interim Services Inc., American Online, Wal-Mart, SuperTarget, Fred Meyer, Teletrust Inc., USANA Inc., Weider Nutrition International, and US Voice Mail.

Contractions and closures with 100 or more workers in 1997 included, but were not limited to: layoffs at Tooele Army Depot, Defense Depot Ogden, Utah Test & Training Range, Mountain Farms Cheese Factory, Thiokol, Iomega, Novell, Incredible Universe, Surety Life, Clive Incineration Facility, and Paracelsus PHC Hospital.

Housing Prices. The average price of the same group of existing houses in Utah increased 74.4% in the 5-year period ending September 30, 1997 (the largest 5 year increase in the nation), according to the Office of Federal Housing Enterprise Oversight's (OFHEO) Housing Price Index. The OFHEO price index measures the average price in repeat sales of the same houses. The growth rate in housing prices as measured by OFHEO peaked at 19.3% in the 2nd quarter of 1994 compared to 2nd quarter 1993, and has since declined to 7.1% year-over growth in the 3rd quarter of 1997, Figure 3.

This 7.1% growth for the period ended September 1997 ranked Utah as 2nd highest in the nation (behind Michigan at 7.2%) for house price appreciation. Utah housing prices as measured by OFHEO increased more than 10% per year for four years in a row, 1993 through 1996. Housing prices are expected to increase 7.5% in 1997 and 5.4% in 1998 as shown on Table 2.

Another housing price measure, the median-average home price in the Salt Lake City/Ogden area, increased to \$131,000 in the 3rd quarter of 1997, according to the National Association of Realtors. Median-priced homes in the Salt Lake/Ogden area in the 3rd quarter of 1997 were \$4,500 more expensive than the \$126,500 national median-existing home average price. The median price is the average price above and below which half of all (old) existing homes sold.

Household Ownership, Income and Annual Pay. The softening of housing prices in 1997 and 1998 is due in part to the high home-ownership rate in Utah (72.7% in Utah versus 65.4% nationwide in 1996, 10th highest in the nation), and the 74.4% run up in housing prices over the last 5 years. Despite low interest rates and high median household incomes, home sales in Utah decreased in 1997. According to the Utah Association of Realtors, home sales declined every quarter from 4th quarter 1996 to 3rd quarter 1997. The declines were 8.1% in 4th quarter 1996, 12.4% for 1st quarter 1997, and 3.1% for both the 2nd and 3rd quarters of 1997.

Part of the reason for above average levels of home ownership is higher than average household income levels in Utah compared to the nation. Just released 1996 data from the Bureau of the Census shows that median household income in Utah ranked 17th highest in the nation at \$37,038 (\$1,546 higher than the national average of \$35,492). Higher median household income, despite lower average annual pay, is due to larger household sizes (more wage earners per household) in Utah than in the nation. The Bureau of Census estimates that there were 3.08 persons per household in Utah in 1996 compared to 2.62 persons in national households.

Average annual pay in Utah remained well below the national average in 1996. Just released wage data shows that Utah ranked 34th in the U.S. at \$24,572 (versus \$28,945 for the nation) in average annual pay for 1996 (Table 3). Still, average pay in Utah grew 4.0% in 1996 (compared to 3.9% nationwide), and in 1997 it grew faster than CPI-U inflation for the 3rd consecutive year in a row.

Lower pay in Utah is usually attributed to more part-time workers and a younger workforce than in the rest of the nation. Another part of the explanation, however, is due to structural changes in Utah's economy that occurred in the mid to late 1980s. Restructuring and downsizing at Geneva Steel and Kennecott Copper, the completion of the Intermountain Power Project, and lower oil prices (exploration) all contributed to lower average annual pay in Utah. Average pay in Utah, adjusted for inflation, was 96% of the national average (about \$1,000 less than the U.S. average) as recently as 1981. Utah's average-annual pay, adjusted for inflation, has been about \$4,000 less than the national average since 1988.

Vacancies and Rents. Mid-year vacancy rates indicate that most of the Salt Lake City real estate market is not yet overbuilt. Nonetheless, Utah is in the midst of a construction boom and many vacancy rates will increase in subsequent years. Industrial vacancy rates for June were 5.3% in Salt Lake City compared to an 8.1% average in cities nationwide, according to a recent study by CB Commercial. CB Commercial Real Estate Group's survey also reported that metropolitan Salt Lake area office market vacancy rate was 5.6% for June of 1997 compared to the same period in 1996. This rate was the 2nd lowest in the nation. The national

office vacancy rate for June was 11.2%.

Continued in-migration, rising rents and a strong economy make the Salt Lake area a desirable place for apartment development according to the Center for Real Estate Studies. Nonetheless, community resistance has made it increasingly difficult to build apartments in the Salt Lake area. Most multi-family projects currently under construction are being built on sites acquired before 1996, according to Equimark Properties. Equimark estimates apartment vacancies in the Greater Salt Lake Area at 4.9% for the end of 2nd quarter 1997, with the average rent around \$600 per apartment. A rate less than 5% is considered a fully occupied market. Ten years ago in 1986-87 vacancy rates were around 20%.

One area where the real estate market may be overbuilding is in hotel (motel) construction. Recent hotel construction has resulted in declining occupancy rates in Utah. Occupied rooms statewide decreased from 66%, to 64.6%, for the first 10 months of 1997 compared to the same period in 1996, according to the *Rocky Mountain Lodging Report*. The report stated that occupancy rates in the Salt Lake area decreased from 84.4% to 78.4% over the same time period. Planned and current construction of additional hotels along the Wasatch Front could result in lower occupancy rates in subsequent years. These additions include, but are not limited to: the downtown Little America, Royal Crown, Kimpton, and La Quinta hotels to be finished by 1999.

Per Capita Income. Recently revised income data show that Utah ranked near the bottom at 44th with a per capita personal income level of \$19,595 in 1996. This was 80.2% of the national level of \$24,426. Still, Utah's per capita income rankings have increased steadily over the past five years, from 49th in the nation in 1992, to 44th in the nation for 1996. Per capita income in Utah has been and should remain considerably below the national average in the foreseeable future due to the large percentage of the population comprised of children. Most recent Bureau of the Census data shows that Utah's median age was the youngest in the nation at 26.8 as of July 1, 1996. This compares to a median age of 34.6 for the nation.

Media Reporting and Rankings. Utah continued to receive favorable rankings and press coverage in 1997. A sampling of these include:

- * Salt Lake/Ogden was named the 9th most attractive entrepreneurial metropolitan area by *Entrepreneur* magazine.
- * *Time* magazine featured an article citing Salt Lake City as the 4th "hottest place" for job growth in the nation. *Time* credited the bio-technology and construction industries for the strong showing.
- * *Time* magazine also ran an article on the successful operations and expansions of the Church of Jesus Christ of Latter Day Saints.
- * *Point of View* magazine ranked Salt Lake City as the 3rd

best in the U.S. to start a business.

- ✱ The *Wall Street Journal* ran an article on Utah's construction boom in 1997.
- ✱ The American Electronics Association ranked Utah 7th among the nations top 10 high-tech job creators.
- ✱ The Wasatch Front was named the number 1 hot spot for entrepreneurial growth by the Association of Foreign Investors in U.S. Real Estate (AFIRE). AFIRE invested \$7 billion in U.S. real estate in 1997.
- ✱ Salt Lake/Ogden ranked 6th out of 313 local economies in economic strength according to a recently released book titled *"Where the Money Is ... America's Strongest Local Economies"*.
- ✱ Morgan Quinto Press ranked Utah as the 4th most-livable state in the nation in 1997.
- ✱ ReliaStar Financial Corporation rated Utah as among the top 10 healthiest places to live in the United States.
- ✱ Utah continued to receive AAA bond ratings from Moody's Investors Service, Standard and Poor's Rating Group, and Fitch Investors Service.
- ✱ Coopers & Lybrand ranked the Salt Lake City International Airport as one of the top 3 best managed airports in the nation.
- ✱ Actuarial & Technical Solutions Inc. rated Utah's workers compensation insurance premiums as 3rd lowest in the nation.
- ✱ The University of Utah and Brigham Young University were ranked in the top 40 law schools nationwide.

1998 Outlook

Indicators. The Utah economy is expected to slow in 1998 due to lower net in-migration; lower residential construction (due to building moratoriums and restrictions); improvements in other state economies (especially California the source of most of Utah's in-migration); slower growth in exports; a tighter labor market; and a less affordable housing market.

Downtown office vacancies should increase somewhat in 1998 due to congestion associated with the reconstruction of I-15 and the opening of the Courts Complex, and the American Stores and Gateway West office towers.

The 1996 California legislature cut corporate income taxes 5% and deregulated electric utilities. As of January 1, 1998, businesses in California will be able to choose their electric suppliers. With electric rates roughly 30% higher than the national average, this will introduce competition and reduce electric rates in California. With lower business taxes and electricity rates, companies may look more favorably towards California as a place to do business.

Net in-migration will decline from 15,000 in 1997, to 10,000 in 1998, due to stronger employment growth in the nation and weaker employment growth in Utah in 1997. U.S. job growth increased from 2% in 1996, to 2.2% in 1997; whereas, it declined from 5.1% to 4.4% in Utah over the same period. This change in relative economic performance

will dampen net in-migration into Utah in 1998.

Still, Utah's economy should continue to do well into 1998 for many of the same reasons it did well in 1997. Utah has a pro-business regulatory environment; low energy costs; low business taxes; numerous recreational opportunities; a youthful and educated laborforce; good universities; healthy lifestyles; and, a strong work ethic that should continue to favorably influence business location and expansion decisions. The State of Utah Economic Coordinating Committee (ECC) expects employment to grow at about 3.6% in 1998 (almost double the national growth rate). The historic (1950-96) average job growth rate in Utah is about 3.6%. Regional Financial Associates (an independent national economic consulting firm) forecast in November 1997 that Utah would rank 3rd in the nation in job growth for 1998 at 3.5%. As shown on Table 2, population growth will increase at 2.0%, total nonagricultural wages should increase at 7.8%, and personal income growth will come in at 7.9% in 1998. Average wage growth in Utah will grow faster than CPI inflation in 1998 for the 4th consecutive year.

Workforce Expansions and Contractions. Several companies have announced permanent workforce expansions and new firm openings of 100 or more jobs in 1998. These expansions and openings include, but are not limited to, TheraTech Inc., Little America Hotel, Smead Manufacturing, Detroit Diesel, Summo USA Corp., U.S. Energy, Micron Technology Inc., Wholesome & Hearty Foods Inc., Gateway 2000, Teletrust Inc., Smithfield Foods, and American Stores. Entities that have announced workforce reductions of 100 or more jobs in 1998 include the Utah Test & Training Range and Bard Access Systems.

Construction Activity. Nonresidential construction will remain at record levels in 1998 due to continued and new business and government projects. On the other hand, residential construction will slow in 1998 despite continued net in-migration and low apartment vacancy rates. This is due to grass-roots, anti-growth activities in the state. Large apartment developers are having difficulty finding communities in which to build.

Nonresidential construction projects of \$20 million or more that will begin or continue into 1998 include, but are not limited to, the Interstate-15 rebuild (\$1.6 billion), The Canyons ski resort expansion (\$210 million), Bangerter Highway (\$72 million), Light Rail (\$312 million), Kennecott Tailings Project (\$510 million), the Courts Complex (\$75 million), the Huntsman Cancer Institute (\$48 million), Gateway West Building (\$25 million), Salt Lake County Jail (\$135 million), Provo Canyon Highway expansion (\$43 million), Cottonwood Corp. Center (\$150 million), Thanksgiving Point (\$60 million), U of U Biology Building (\$24 million), Zermatt Swiss Resort (\$40 million), Little America Hotel (\$185 million), BYU HB Lee Library (\$30 million), SnowBasin ski resort expansion (\$67 million), Dixie Center Convention Hall (\$20 million), Weber State

University VA Browning building (\$20 million), the LDS Assembly Hall (\$240 million), U of U Rice Stadium (\$55 million), Provo Towne Centre (\$100 million), Utah Valley Regional Medical Center (\$91 million), Logan Canyon Highway rebuild (\$60 million), Park City ski resort expansion (\$150 million), Deer Valley ski resort (\$100 million), Gateway 2000 plant (\$22 million), Provo Shops of Riverwoods (\$30 million), South Jordan office/movie complex (\$70 million), the Skaggs Catholic Center (\$50 million), U of U Olympic Village (\$120 million), USU Widtsoe Hall rebuild (\$24 million), Royal Crown Hotel (\$35 million), the Draper Women's Correction Facility (\$24 million), Ogden Standard Examiner building (\$20 million), Kimpton Hotel (\$25 million), the Winter Sports Park expansion (\$48 million), and the Richfield Events Center (\$20 million). Design of the Salt Lake Airport rebuild (\$994 million), will begin in 1998 with construction beginning in April 1999.

Significant Issues

Construction Activity. Construction continues to be the fastest growing industry in the Utah economy. Nonresidential construction reached new historic highs in 1997 and should continue at record levels into 1998. The largest projects currently under construction include the \$1.6 billion reconstruction of Interstate 15, the \$312 million TRAX (Light Rail) project, the \$135 million Salt Lake County Jail, the \$185 million Little America Hotel, and the \$240 million LDS Assembly Hall. The rebuild of Interstate 15 will directly employ around 3,000 persons working two 10 hour shifts at peak construction in 1998. Approximately one-half of these jobs will be with the principal contractor (Wasatch

Constructors) and the other one-half will be with subcontractors. TRAX should directly employ around 400 workers at peak construction.

Hill Air Force Base. Utah received good news in 1997 regarding one of its largest employers Hill Air Force Base (HAFB). President Clinton signed a defense bill which bans any preferences for keeping defense work at McClellan Air Force Base in California or Kelly Air Force Base in Texas. These bases had been targeted for closure by the 1995 Base Closure Commission. HAFB must still bid against these other bases for defense work, and there remains the danger that the 388th Fighter Wing at HAFB could be relocated to another base. HAFB is currently operating at around 50% capacity and needs additional work to survive future rounds of base closures. The Department of Defense has recommended another round of base closings in 2001. The Pentagon has announced that it may decide the fate of the 388th Fighter Wing as early as January of 1998. Any beneficial or adverse effects from changes at HAFB are not included in the assumptions or economic indicators presented in Table 2.

Asian Economic Crisis. A recent report by Standard & Poor's showed Utah among the 10 states that will be most affected by the recent Asian economic crisis. Utah ranks 7th in terms of per capita exports to Asia. About 40% of Utah's exports (mostly coal, copper and equipment) go to Asia. Japan is Utah's largest Asian customer. Utah's exports were \$3.49 billion in 1997, down from \$3.62 billion in 1996 and \$3.65 billion in 1995. *

Utah's Long-Term Projections

Overview

Utah's population surpassed 2.0 million in 1996 and is expected to reach 3.3 million by the year 2020 -- a 65% increase. This rate of population growth, which exceeds that of the nation, will be sustained by a rapid rate of natural increase and a strong and diversified economy. The state's employment growth rate is also expected to be more rapid than that of the nation. The most rapid rates of population growth are expected in southwestern Utah and Grand, Summit, and Wasatch Counties.

Long term demographic and economic projections for the state of Utah have been produced by the Demographic and Economic Analysis Section of the Governor's Office of Planning and Budget (GOPB). These projections represent the State's official view of Utah's future and inform a multitude of planning efforts. These county level baseline projections to the year 2020 were released in January 1997.¹

Subsequent to the release of these numbers, median ages and household projections--including calculations of persons per household--have been revised. Rankings of median ages and Hachman Indices by county are other new data sets which have been organized. An extensive on-line database has been built and is available on the World Wide Web at <http://www.gget.state.ut.us/projections/>. The system enables customized retrieval, analysis, and visualization of historical and projected demographic and economic information.

State Population and Employment Projections

Utah's population surpassed 2.0 million in 1996 and is expected to reach 3.3 million by the year 2020; a 65% increase. (Table 4) This rate of population growth, which exceeds that expected for the nation, will be sustained by: (1) a rapid rate of natural increase (i.e., births exceeding deaths) and, (2) a strong and diversified economy. The state's employment growth rate is also expected to be more rapid than that of the nation. If these rates of economic growth are obtained, Utah will experience a sustained net in-migration over nearly the entire projection period. This net-in-migration will occur because, even though the state's population is quite young and fertility rates are relatively high, there will not be adequate internal growth of the labor force to match the demand for labor. In absolute numbers, the majority of the 1.3 million new Utahns will reside on the Wasatch Front. The most rapid rates of growth are expected in southwestern Utah, Grand County, and the "Wasatch Back" (Summit and Wasatch Counties). (Table 11)

¹ This means that the last year of historical data in these projections is 1995 for employment and 1996 for population.

Population Growth Rates. The growth rate of Utah's population has historically exceeded that of the nation; this trend is expected to continue throughout the projection period. The average annual rate of growth of Utah's population over the projection period (1995 to 2020) is expected to be 2.1%. This rate compares with an average annual rate of growth of 2.3% in the historical period (1950 to 1995). Corresponding rates of growth for the nation are 1.2% in the historical period and 0.9% in the projected period.

Population growth rates fluctuate over time according to economic conditions, specific events, and population dynamics. Even when Utah experienced difficult economic times in the 1980s, the rate of growth of the population for the decade still exceeded that of the nation. The largest growth rate differential occurred in the 1970s, when Utah's average annual rate of population growth was 3.3% while that of the nation was 1.1%. A similar, yet smaller differential is projected for the first ten years of the next century, when Utah's annual average population growth rate is projected to be 2.4% while the nation's is projected to be 0.8% (Figure 4).

Population Increases. In the 1950-to-1996 period, total population of the state has consistently increased, although the amounts of annual increase have varied cyclically. Population increased an average of 40,800 persons per year throughout the decade of the 1970s, and 25,510 in the 1980s. Projections indicate that population will increase by an average amount of 44,341 in the 1990s, by 56,468 in the 2000s, and by 57,411 in the 2010s. So, while rates of population growth are expected to decelerate in the later years of the projection period, absolute amounts of growth are expected to be quite high relative to history, Table 6.

Natural Increase. Utah's rapid rate of population growth is primarily attributable to natural increase rather than in-migration.² This rapid rate of natural increase has occurred because the population is quite young (with a greater share of the population in childbearing years) and fertility rates are quite high. In addition to births and deaths, the third component of population change is net migration. Net in-migration was quite small in the 1950s and net out-migration occurred in the 1960s and 1980s. Over the last 45 years, with only three exceptions (1954, 1964, and 1988), even in times of net out-migration (the 1980s), Utah's rate of population increase has consistently exceeded that of the nation. These projections indicate that natural increase will

² The amount of natural increase for a given population is the amount by which the number of births exceeds the number of deaths for a particular year. If deaths exceed births then there is a natural decrease.

contribute 65% of the population increase over the next 25 years. (Figure 5 and Table 6)

The relatively rapid rate of natural increase of the Utah population is mostly attributable to the state's young population in combination with a high fertility rate, although a relatively low death rate and high life expectancy have contributed to a lesser extent. Median age for the state has increased from 24 in 1980 to 27 in 1995, and is projected to increase to 31 by the year 2020. The national median age was 30 in 1980, 34 in 1995, and is projected to increase to 38 in the year 2020. (Table 7 and 8)

Age Structure. Age structure may be summarized by the dependency ratio, which is the number of people in the population not in the working age group per 100 working age persons (18 through 64 years old). Utah's dependency ratio is consistently among the highest in the nation. In 1970 it was 90 for Utah compared with 79 nationally. By 1995 it had fallen to 76 in Utah and 64 for the nation. By 2020, the projected dependency ratio for Utah is 70 and 67 for the nation.

The increasing national dependency ratio toward the end of the projection period is attributable to the aging of the Baby Boom generation. For the nation, the retirement component was 33% of the dependency group in 1995 and is projected to increase to 41% by 2020. In the case of Utah, the retirement age component of the state's dependency ratio was about 20% in 1995 and is projected to increase to 26% in 2020. The school age (ages 5 through 17) portion of the population for the state is projected to decrease from 25% in 1995 to 22% in 2020.

Throughout the projection period, Utah's age structure will maintain its unique character as compared with the nation, although there will be slight tendency to converge. The median age of Utah's population will increase over the projection period, as will that of the nation. However, Utah's population will continue to be between 6.5 and 8 years younger than that of the nation by this measure. (Table 8 through 10, Figures 6 and 7)

Employment. Non-agricultural payroll employment is projected to increase by about 79% from around 908,000 in 1995 to 1,629,281 in the year 2020. Total employment for Utah is projected to increase from 1,100,273 in 1995 to 1,977,156 in 2020; an increase of 80%.¹

The employment growth rate of Utah has quite consistently out-paced that of the nation and this differential is projected to continue. The average annual rate of growth of non-agricultural payroll employment from 1950 to 1995 was

¹ Total employment for UPED purposes is non-agricultural payroll employment plus agriculture (payroll employment and proprietors) plus private household employment plus non-farm proprietors. The Bureau of Economic Analysis estimates the latter three.

3.5% for Utah as compared to 2.1% for the nation. The projected rates for 1995 through 2020 are 2.4% and 1.0% respectively. The decade with the highest rate of employment growth for the state was the 1970s, when non-agricultural payroll employment increased at an average annual rate of 4.5%; this increase compares to the national rate of 2.7%. Over the projection period, the 1990s are expected to have an average annual rate of growth of 4.1% with rates decelerating over time. (Table 5)

Although the rates of increase of employment are not projected to reach record levels, the numbers of jobs created are projected to reach record levels. The average annual amounts of increase of non-agricultural payroll employment peaked in the 1970s at 19,316 jobs. This number is projected to increase to 34,629 in the 1990s, 29,072 for the 2000s, and 26,827 for the 2010s.

Employment Growth by Sector. With the exception of agriculture, employment increases are projected for all major sectors of Utah's economy. Services, non-farm proprietors, TCPU (transportation, communication, and public utilities), trade, and FIRE (finance, insurance, and real estate) are projected to have the most rapid rates of increase (i.e., average annual rates of growth in excess of 2.0% in the years 1995 to 2020). Employment is projected to grow more rapidly (or in the case of agriculture decrease less rapidly) in every sector in the state than in the nation. Manufacturing employment is projected to increase in Utah while declining for the national economy. About one-third (31%) of all jobs created in Utah in the 1995 to 2020 period are projected to be service jobs, which is now and will continue to be the sector with the largest share of the state's employment. This compares to 46% at the national level. A greater share of employment will be created in trade, TCPU, manufacturing, construction, and government in the state as compared to the nation. (Table 5)

At the detailed industry level, the most rapidly growing sectors are business services, transportation services, agricultural services, professional services, medical and health services, repair services, and social services. These sectors have average annual rates of growth for the 1995 to 2020 projected period in excess of 3.1%. The industry that is projected to create the largest number of jobs in the next 25 years is non-farm proprietors (156,821 jobs), followed by business services (75,238), medical and health services (73,872), and eating and drinking places (48,481). (Figures 9 and 12)

Diversification. The state's economy has become more diverse (i.e., more similar to the economic structure of the nation) over time as its employment has grown more rapidly in industries in which it was relatively unspecialized. This increasing diversification of the state's economy is evident at both the major industry and detailed industry levels as

measured by the Hachman Index.¹ A value of one indicates an identical distribution of employment shares between the subject region (the state) and the reference region (the nation). The increase in the value of the index in the 1980 to 1995 period is primarily the result of the simultaneous occurrence of: (1) the restructuring of the mining and metals industries and the downsizing of the federal government, and (2) emergence and/or growth of service industries (e.g., computer software development / production, financial services, temporary services, telemarketing, etc.), tourism related industries (e.g., hotels and lodging, transportation by air, etc.), and particular types of manufacturing (e.g., motor vehicle parts (air bags), aircraft equipment, sporting goods, etc.).

This restructuring and diversification process has nearly run its course. The Hachman Index for the state is approaching one (its theoretical maximum) when calculated at the major industry level and approaching 0.95 at the two-digit detailed industry level. These projections indicate that the industrial structure of the state will become somewhat more diversified (i.e., more similar to that of the nation) over the next 25 years, although a differential as measured by the Hachman Index will be sustained. (Figure 8)

County Population, Household, and Employment Projections

All 29 counties are expected to gain population, households, and employment in the years 1995 to 2020. The most rapid rates of growth are in southwest Utah, Grand County, and the "Wasatch Back" (Summit and Wasatch Counties). In terms of amounts of population, much of the increase is concentrated in the Wasatch Front counties.

Population. The population of the state is geographically concentrated in the Wasatch Front MCD (Davis, Morgan, Salt Lake, Tooele, and Weber Counties). These counties have 63% of the state's population and 67% of the state's employment. These proportions are projected to decline somewhat in the next quarter century. The absolute number of persons in the Wasatch Front is projected to increase from 1,233,100 in 1995 to 2,010,354 in the year 2020, for an increase of 777,254 people or 63% (Table 11 through 14).

The most rapidly growing counties (in terms of average annual rates of growth) in the state are projected to be Washington, Grand, Iron, Summit, Wasatch, and Kane. The counties with the largest projected absolute increases in the

population from 1990 to 2020 are Salt Lake, Utah, Davis, Washington, Weber, and Cache (Table 11).

Median Age. The median age of the population is projected to increase for all counties over the projection period except Piute county, which is ranked as the oldest county from 1990 to 2020. The counties with the youngest population in 1990 were San Juan, Utah, Cache, and Sanpete while the counties with the oldest population were Beaver, Grand, and Piute. By 2020 the counties with the youngest population, as measured by median age, are projected to be Utah, Cache, Iron, and Wasatch, while those projected to have the highest median age are Daggett, Emery, and Piute. (Table 15).

Households. Household growth is projected to be more rapid than population growth, although the growth rate differentials vary from county to county. (Table 12) The rankings of counties by growth rates of households in the 1990 to 2020 period differs slightly from that of population. In terms of rates of growth, the number of households is projected to grow most rapidly in Washington, Grand, Iron, Summit, Kane, and Wasatch. The average number of persons per household is projected to decline for all counties. In 1990, the counties with the highest number of persons per household were San Juan, Utah, Morgan, Davis, and Emery. By 2020, the counties with the highest projected number of persons per household are Utah, Box Elder, Wasatch, Cache, and Rich (Table 13).

Employment. Employment growth is projected to be most rapid from 1990 to 2020 for Washington, Kane, Iron, Summit, Beaver, and Wasatch counties, while the largest number of jobs created in the 1990 to 2020 are projected for Salt Lake, Utah, Weber, Davis, and Washington counties (Table 14).

For most counties the Hachman Index is projected to increase from 1980 to 2020. The exceptions are Cache, Box Elder, Beaver, and Piute. The state's largest counties have Hachman Indices closest to one: Salt Lake, Utah, and Weber. Emery county's Hachman Index indicates its sectoral distribution is most different from that of the nation; this is because of the specialization in coal mining and electric generation (Table 16).

Economic

Development

Activities

Economic Development Activities

Overview

The overriding economic development issue this year is an increasing labor shortage which has resulted from Utah's exceptional economic growth over the last decade. Indicators of such a shortage abound. Nonagricultural employment has averaged 4.4% growth over the last 10 years, while unemployment rates have plummeted from 6.4% in 1987 to 3.2% today. Wages have risen at an average of 3.5% per year since 1991. And while Utah's labor force participation rate has grown to 71.8% in 1995, the rate of growth has tapered off. In response to tight labor market conditions, state and local economic development activities should focus on attracting higher-paying jobs and increasing employees' skills.

Utah's Labor Force

In addition to a central location, abundant natural resources, and relatively low energy costs, economic development efforts in Utah have traditionally benefitted from the state's unique labor force. One advantage has been the rapid growth of the Utah labor force relative to the nation. Since 1960 the population in Utah has increased an average of 2.3% per year, compared to 1% for the U.S. During this period, in-migration averaged 13,000 yearly, until the brief out-migration of the mid-1980s recession, and then a positive 18,000 per year since.

A second advantage is that Utah's labor force is relatively well educated. Utah ranks 2nd in the percentage of the population completing high school, 85.1%. It ranks 4th in those with a high school diploma and a college education up to a Bachelor's (62.9%), and it places 14th (22.2%) for those with a Bachelor's degree or higher.

Another advantage is the comparatively young workforce. The average age of the U.S. labor force is over 41 years, while in Utah it is 37 years. Along with a young workforce comes competitive wage rates. The national average annual wage in 1996 was \$28,945 compared to \$24,572 in Utah.

Another characteristic of the workforce that is a noteworthy advantage is the strong work ethic. Surveys of companies and business executives routinely compliment Utah workers on their strong work ethic.

Labor Shortages

After recovering from the 1991 recession, the national economy is now growing at a record-breaking pace. This is now the third longest expansion since 1920, unemployment and inflation rates are at generational lows, and the current 4.6% jobless rate was last seen on a consistent basis a quarter century ago. The strength of the labor market is even more apparent regionally. Nearly two-thirds of the

nation's 300 plus metropolitan areas have unemployment rates below 5%. Even in the late 1980s (the last time labor was in short supply nationally) fewer than one-half of metro areas had jobless rates as low. Virtually every state is now hearing complaints of a shortage of qualified workers:

In Utah, where growth has been stronger and lasted longer than every state except Nevada, there are signs of a similar labor shortage. Non-agricultural jobs have risen an average of 4.5% per year over the last 10 years in Utah, reaching a high of 6.2% in 1994. However, it has now slowed to 4.4% in 1997 and is expected to average 3.3% through 2005. While the number of non-agricultural jobs has grown 4.5% per year, the labor force has increased only 2.9% per year. The unemployment rate has fallen from a high of 6.4% in 1987 to 3.2% in 1997. Indeed, it has been under 5% (essentially at or below full employment) for ten years.

Another indicator is Utah's relatively high labor force participation rates. In 1960, the U.S. labor force participation rate was 60.0% (37.7% for females) versus Utah's 57.4% (33.5% for females). In 1995, the U.S. rate was 66.6% (58.9% for females) and the Utah rate was 71.8% (61.2% for females). However, the ability to continue drawing participants into the labor force has limits. Since 1990, the growth in the labor force participation rate in Utah has slowed to half of what it was, and is approaching the national average.

Rising wages, either generally or in specific occupations or industries, is another sign of labor shortages. While wages in Utah increased an average of 3.4% per year between 1991 and 1996, wages in Retail Trade increased an average of 4.8%, with Eating and Drinking Establishments increasing an average of 4.7%. Wages in Services, Hotels and Motels have increased an average of 3.6%.

Another indicator of a tight labor market is The Conference Board's Help Wanted Index. The Conference Board surveys help-wanted advertising volume in 51 major newspapers across the country every month. Because ad volume has proven to be sensitive to labor market conditions, this measure provides a gauge of change in the local, regional and national supply of jobs. Salt Lake City has had the highest help wanted index of all major metropolitan areas since 1993.

Productivity and Skills

Recent analysis indicates that Utah workers are still some 5% to 6% more productive than the national average. However, this advantage can change because of rising wages and the hiring of individuals that may not have the work experience or education previously available.

Productivity is measured by output per unit of input employed. Increases in productivity result from increased efficiency on the part of capital and labor. Two commonly used measures of productivity are output per hour of work and output per dollar of wage. The average wages and salaries earned per dollar of output created (the Gross State Product) is also termed the unit labor cost, and is a useful estimate of overall worker productivity. Adjusting for various factors that affect wages and GSP (such as levels of part-time workers, industry mix, and proportionally fewer large corporate headquarters), the unit labor cost in Utah is about 94% of the national average—placing Utah in the top 10% of states in terms of labor productivity. However, if everything else remains the same, and Utah's wages continue to increase faster than the national average, some of this "productivity advantage" will erode.

In addition to rising wages, a productivity slowdown may also be caused by deterioration in individual worker productivity. As the labor market tightens, firms begin to hire less skilled and less committed workers to meet demand. These newly hired workers are often not as productive as existing workers.

According to a recent survey conducted by the National Association of Manufacturers and Grant Thornton, 88% of U.S. manufacturers report a shortage of qualified workers in at least one job category. Approximately 60% say their workers lack basic math skills, 55% find their workers are seriously weak in basic writing and comprehension skills, and 63% say their workers are tardy, chronically absent, or unwilling to work a full day. Half found it difficult to give employees more responsibility. Two-thirds say they are having difficulty improving productivity and upgrading technology.

Conditions in Utah are still relatively much better. Nevertheless, a December 1995 survey conducted by Dan Jones and Associates for the Utah Partnership for Educational and Economic Development found that the primary challenge facing employers in Utah is finding qualified applicants (65%). Also, 57% said they needed employees with basic reading, math, and communication skills. A need for worker "teachability" and technological literacy was cited by 20%. Almost 40% claimed problems finding new workers with a strong work ethic/positive character attributes. Again, this can be mostly attributed to the fact that Utah's well qualified labor force is fully employed.

Economic Development Initiatives

Diversification. In response, Utah's economic development agencies are focusing on three areas. First, the state continues to try to diversify its economy. This is especially important in the non-metro areas. Rather than just trying to attract new businesses, Utah attempts to recruit and encourage the expansion of relatively high paying industries, specifically those that fit within its identified (export) industry

clusters. Not only does this increase the wealth of the state, but it also stimulates the in-migration of skilled workers, attracted to high paying industries and occupations. Without the expansion of higher wage export industries to attract skilled workers and an increased investment in technology and worker re-training, growth will stagnate, placing the state at a comparative disadvantage.

Industrial Assistance Fund. Specific programs designed to address this need include the Industrial Assistance Fund and the Enterprise Zone program. Established by the 1991 Legislature as an incentive for substantial and extraordinary economic growth within the state, the Industrial Assistance Fund (IAF) recently was amended to give Utah's rural communities broader access to the fund. As a result of this 1994 legislative amendment, (1) out-of-state businesses and (2) Wasatch Front expansions (with 10 to 100 employees) which move to "economically disadvantaged rural areas" will be reimbursed all, or part, of their relocation costs up to \$100,000.

Enterprise Zones. The Utah Enterprise Zone Program was established in 1988 and amended in 1996. An enterprise zone comprises a municipality or county in non-metropolitan areas of the state, identified by local elected and economic development officials, and designated by the state, as needing incentives to stimulate and diversify the local economy. Under the program, certain types of businesses locating to, or expanding in a designated zone may claim tax credits provided in the law.

Training and Technology. The second area of focus is to encourage continued investment in technology and workers by Utah businesses. Combined with the investments businesses are making in increasing their use of technology and upgrading their equipment, the advanced skills these investments require are leading employers to enhance programs that retrain workers. In-house training is encouraged by the state.

Employers increasingly recognize the need to retain qualified employees. According to the National Association of Manufacturer's survey, just over 80% of respondents offer educational and training opportunities, beyond remedial programs, to employees. In addition, 96% of respondents spent money to train non-management workers. Nearly half of respondents invested 2% or more of payroll to train shop floor and other hourly workers. This compares to 1991 survey results which found that companies were spending an average of less than 0.5%.

An indication of Utah's lead in this area, is a survey of employers sponsored by the Department of Community and Economic Development, also in 1991. At that time, 87% of Utah employers surveyed offered some "in-house" training, and of those 12% offered basic/remedial skills, 64% offered management training, and 86% offered training in technical skills. The percentages have undoubtedly increased since.

Custom Fit Training/Manufacturing Extension Program.

In Utah, a variety of programs are designed to assist this effort. The Custom Fit Training Program offers specialized training to meet employers' specific needs. Also, the Department of Community and Economic Development has been instrumental in the formation of the Utah Manufacturing Extension Program (UMEP). UMEP has field and project engineers throughout the state and service centers in Utah colleges and universities. The programs provide small and mid-sized manufacturers with access to a variety of tools, techniques, and other resources to enhance the productivity and technological performance of manufacturers.

Education and Training Needs. The third focus centers on working to decrease the mismatches that occur between education and job training agencies/workers and students/and businesses. The Utah Partnership Survey revealed that over 2/3 of employers interviewed felt that business, education, and other state agency linkages were an important step in increasing the quality of new workers.

One of the goals of the Utah Partnership itself is to identify and articulate education and training needs in the work place and facilitate delivery of related work force skills and training. The Office of Education is promoting several programs, including the Schools-to-Careers Program, to meet these needs.

Another major step towards increasing these linkages was the creation of the Department of Workforce Services on July 1, 1997. The agencies which have been integrated into the Department of Workforce Services include the Department of Employment Security which oversees

Unemployment Insurance, Employment Services, and Labor Market Information; the Office of Family Support which administers public assistance programs such as the Family Employment Program, Food Stamps and subsidized Child Care; the Office of Job Training which coordinates all job training programs including the Job Training Partnership Act (JTPA); the Office of Child Care which works with employers in the state to ensure that quality child care is available to those who are employed; and the Turning Point Program which serves displaced homemakers by providing educational opportunities and other employment-related services.

Finally, the Utah Business Resource Network (UBRN) is designed to coordinate access to all the information needed to start a business. The UBRN now includes 19 partners and has 11 regional centers in place.

Conclusion

Labor shortages are a natural economic occurrence, and they are subject to broad supply and demand forces. There are limits to the direct action that government can take to assure an adequate labor supply for businesses in times of rapid economic expansion. What government and the private sector can do is work together to mitigate the costs of such growth, assure the quality of the labor force available, and take the opportunity provided to strengthen and diversify the economy, laying the groundwork for stable growth in the future. While Utah has a variety of programs in place to help this effort, the need is acute and programs to increase the quality of Utah's labor force need to be supported and expanded. ❁

Economic

Indicators

Demographics

Overview

Although the size of Utah's population is still relatively small in comparison to other states, the growth, composition, and distribution of the population is unique. Utah's population grows more rapidly, is younger, lives longer, has larger household sizes, and is more urban than the national average. Changes are occurring, however, as the population becomes older, household formation becomes less oriented toward married-couple families, and the population becomes more racially and ethnically diverse. Further, the concentration of the population continues to spread to counties close to the metropolitan areas and to counties in the Southwest region of the state.

1997 Summary

State Population Growth. Between July 1, 1996 and July 1, 1997, Utah's population grew by approximately 46,353 people—from 2,002,400 to 2,048,753. This preliminary estimate was produced by the Utah Population Estimates Committee and implies a net in-migration of 15,037 persons.¹ As shown in Figure 11, the level of change indicates an annual growth rate of 2.3% between 1996 and 1997, which is slightly higher than the 2.2% growth rate for the previous year. Table 17 presents population estimates, along with the components of population change—migration and natural increase—for the past 45 years.

County Populations. Almost every county in Utah experienced population increases between 1996 and 1997. Utah County experienced the largest net in-migration with approximately 5,722 persons. Three other counties -- Davis, Tooele, and Washington -- also experienced net in-migration of at least 1,000 persons. Twenty-four of Utah's 29 counties experienced net in-migration in 1997, compared to 26 in 1996.

In terms of growth rates, Tooele County led the state with 4.9% growth. Summit, Washington and Iron counties tied for the second fastest growth with 4.7%, followed by Utah County (4.1%) and Juab County (3.5%). In 1997, five of Utah's counties experienced growth of 4% or more, compared to six in 1996. Table 20 presents the preliminary 1997 county population estimates, along with the estimates since 1980.

City Populations. Utah's capital city continues to be the largest city in the state with an estimated 1996 population of 172,575. Salt Lake City has now registered six consecutive years of population growth. This sustained growth is of particular interest because it indicates that Salt Lake City is

once again attracting new residents following a 3-decade long decline in the central city's population from 1960 to 1990.

From 1995 to 1996, half of the top ten fastest growing cities with a population over 10,000 were located at least in part in Utah County. These cities, with their respective population growth rates are; Lehi (10.7%), Spanish Fork (8.2%), Pleasant Grove (8.1%), American Fork (4.7%) and part of Draper (21.6%). Related to growth in Utah County is the continued rapid growth in the southern portion of Salt Lake County. Riverton and Draper rank as the two fastest growing cities over 10,000 population from 1995 to 1996 in Utah. Table 27 presents the Bureau of the Census 1996 sub-county population estimates.

Components of Change

Natural Increase. Natural increase is the number of births minus the number of deaths. The number of deaths in Utah has climbed proportionally with the total population. The number of births peaked in 1982 and has declined almost every year, until 1991 and 1992 when the number of births increased slightly. Births fell once again in 1993 and then increased from 1994 to 1997. Utah births and deaths are provided in Table 17.

The total fertility rate is the number of births a woman would have during her lifetime if, at each year of age, she experienced the birth rate occurring for that specific year. Fertility rates declined in Utah from 3.28 births per woman in 1979 to a low of 2.48 in 1987. Since 1987, Utah's total fertility rate has climbed as high as 2.61 and is currently 2.55. Utah's total fertility rate is the highest in the nation. The national rate averaged approximately 1.81 births per woman from 1977 through 1986 and has since climbed as high as 2.08, but is 2.06 currently. Historical fertility rates for Utah and the nation are illustrated in Figure 13 and listed in Table 18.

Data on life expectancy, the average remaining lifetime in years for persons who attain a given age, are computed and published annually for the U.S. by the National Center for Health Statistics. Life expectancy tables for states are published every ten years. Table 19 shows life expectancy for Utah and the U.S. for the years 1970, 1980 and 1990. Life expectancy for Utahns has consistently been higher than the national average, females in both Utah and the nation have a higher life expectancy than males.

Migration. Utah has experienced net in-migration for the seventh year in a row. Net migration is derived by calculating the difference between the population change and the natural increase for a given year. Net in-migration occurs when the population increase exceeds the natural

¹ This article utilizes locally produced estimates when available. Otherwise, the Bureau of the Census is the source for population, race and ethnicity, age structure, and housing characteristics.

increase, net out-migration occurs when the natural increase exceeds the population increase. During 1997, Utah experienced net in-migration of 15,037 persons (Figure 12). The last seven years account for the only years of net in-migration since 1983. Utah in 1997, as in the previous six years, experienced robust employment growth. However, over the last 40 years, the highest annual migration rates (net in-migration as a percent of total population) were during the 1970s.

An estimated 76% of Utah's population is concentrated along the metropolitan area comprised of Salt Lake, Davis, Weber, and Utah Counties. Over the last five years, net migration in non-metropolitan counties has steadily increased. In 1992, counties outside the metropolitan area accounted for one-third (32.4%) of total net in-migration. In 1997, almost half (48.7%) of the net in-migration is attributed to non-metropolitan counties.

Table 21 shows net in-migration to Utah by state based on year to year changes in tax return addresses. Data from the Internal Revenue Service and the 1990 Census illuminate several interesting points:

- ✧ California dominates the flow of interstate migration to and from Utah.
- ✧ The extended Salt Lake area has strong migration ties with major metropolitan areas south and or west of Utah (Los Angeles, Phoenix, Portland, Seattle, Las Vegas).
- ✧ Employment-related migration accounts for the vast majority of population movement to and from Utah.

The Utah Consumer Survey, conducted by Valley Research Inc., provides detailed information concerning people who have moved to Utah in the last three years. Recent migrants appear to be slightly different from the long time resident population in a number of ways. Migrants are more likely than residents to be college students or other individuals between 18 to 29 years old. As has been the case in all the Consumer Survey's conducted since the 1980s, a modestly higher proportion of non-Whites are migrating to Utah. Migrants tend to prefer living along the Wasatch Front more than residents and there tends to be proportionately fewer who characterize their religious affiliation as Latter Day Saints among recent migrants. Perhaps because they are younger, the median income of migrants is lower, migrants are less likely to be married and , if they are married, they tend to have a smaller household size.

Composition

Age. The U.S. Bureau of the Census produces annual state population estimates by age group. The most recent data available are for 1996. These data demonstrate that Utah continues to have a very young population relative to the nation. Utah ranks first in the percent of the population under five years of age--9.4%--and first in the percent of the population aged 5 to 17, 24.5%. Utah has the youngest median age in the country--26.8 years old--compared to a

national median age of 34.6 years old.

Utah's age characteristics can be summarized in terms of a demographic construct called a dependency ratio. The dependency ratio measures the number of dependents (defined as persons younger than age 18 and older than age 64) per 100 persons of working age (defined as persons in the age group 18 to 64). Utah's dependency ratio is 75 compared to the national average of 63. This means that for every 100 persons of working age in Utah, 12 more dependents than the national average must be supported. Utah's dependency ratio is the highest in the country and even significantly higher than the next closest state. Table 23 provides dependency ratios for every state and the District of Columbia.

Race/Ethnicity. The Utah Department of Workforce Services has prepared 1994 estimates of the population by race and Hispanic origin at the county level in Utah. The estimates were based on Utah public school enrollment data by race from 1970 to 1994, and the modified age, race and sex estimates published by the Bureau of the Census for 1980 and 1990.

Table 25 provides race and ethnic population numbers for 1980 and 1990, along with 1994 estimates. These estimates show that Utah's minority population, as a percent of the total population, is still relatively small. However, the minority population's share is gradually increasing. In 1980, Utah's White population comprised 92.7% of the total, compared to 91.2% in 1990, and an estimated 89.4% in 1994. This gradual shift in the racial and ethnic composition of the state is occurring because Utah's minority populations are increasing at a faster rate than the White population. From 1990 to 1994, Utah's White population increased by an estimated 8.9%. In comparison, over the same period, Asian/Pacific Islanders increased by an estimated 39.3%; Hispanics by 37.8%; Blacks by 30.9%; and American Indian/Alaskan Native 18.9%.¹

The Office of Management and Budget (OMB) recently released a final decision that revises the standards used to classify federal data on race and ethnicity. These revisions replace and supersede Statistical Policy Directive No. 15. The new standards will be used by the Bureau of the Census in the 2000 decennial census. Other Federal programs have been instructed to adopt these standards as soon as possible, but not later than January 1, 2003. The new standards retain a minimum set of race and ethnicity categories, and for the first time, give respondents the opportunity to identify themselves by selecting more than one race category. OMB has specified five minimum categories for collecting data on race (White, Black or

¹ Note that the growth rates for Utah's minority population are computed from a much smaller population base and relatively small numeric changes can result in high growth rates.

African American, Asian, Native Hawaiian or Other Pacific Islander, American Indian or Alaska Native), and two categories for collecting data on ethnicity (Hispanic or Latino, Not Hispanic or Latino).

Household Characteristics. Table 24 provides household characteristics and rankings from the 1990 Census for the United States, the District of Columbia, and states. Utah ranks first in the percentage of persons living in family households--88.5%. A family household is defined by the Census Bureau as a householder and one or more other persons living in the same household who are related to the householder by birth, marriage, or adoption. Utah ranks last in the percentage of persons living in group quarters--1.7%. Group quarters include both institutionalized quarters--prisons or nursing homes--and noninstitutionalized quarters--college dormitories or shelters.

According to the 1990 Census, 64.8% of Utah households are comprised of married-couple families, which ranks Utah first. Utah has a lower-than-average ranking of single-headed households--11.7% of households are comprised of single parents, ranking Utah 41st in the nation. Utah also has the most persons per household nationally, 3.15, and most persons per family, 3.67.

Data on the number of housing units, households, and persons per household in 1996 is shown in Table 26. Utah currently ranks first in the nation with 3.08 persons per household. From 1990 to 1996, Utah was one of 16 states that experienced a 10% or larger growth rate in the total number of households, almost twice the national rate. During this time period, Utah's population grew 15.8% while the number of households grew 19.0%.

Higher growth in households than population can be explained by significant changes in family formation which have occurred over the past several decades. Figure 14 shows family formation trends in Utah based on 1970, 1980 and 1990 census data. Only single female parent families and 'other' families, show growth from 1970 to 1990. While the number of single-headed households and people living alone have increased, there is a smaller proportion of traditional two-parent families with children. Relatives, such as two siblings living together, would be an example of a family classified in the 'other' category.

Population Distribution

Metropolitan Areas. Utah's population is heavily concentrated along the Wasatch Front, two metropolitan areas comprised of Salt Lake, Davis, Weber and Utah counties.¹ Of the state's twenty-nine counties, Salt Lake County is the most heavily populated with 830,280 residents, followed by Utah County (330,803), Davis

(224,307) and Weber County (181,045). These counties represent approximately 76% of the state's total population. Counties in close proximity to the Wasatch Front have shown significant growth over the last several years. The combined population in these counties -- Box Elder, Cache, Tooele, Juab, Morgan, Summit, and Wasatch -- represents 208,595 residents or 10.2% of the state's total population. These counties are currently of great interest because of their proximity to metropolitan Utah and their increasing integration with the employment and trade patterns of the Wasatch Front.

Regional Developments. Cache County to the north and Washington and Iron counties to the south are important to mention due to the phenomenal growth which has occurred in these two areas since 1990. From 1980 to 1997, the state's population increased at an average annual rate of 2.0%. Washington County's population grew an average 6.4%, Iron County grew 3.1%, and Cache County grew more than 2.2% each year. The population concentrated in Washington and Iron counties represent 5.2% of the total population in the state, and 86.6% of the state's Southwest region. The Southwest region includes Beaver, Garfield and Kane in addition to Washington and Iron counties. Cache County represents 4.1% of the state's total population, and 66.7% of the Bear River region, which is comprised of Cache, Box Elder and Rich counties.

Urbanization. In comparison to other states, Utah ranks as the sixth most urban, according to the 1990 decennial census. The U.S. Bureau of the Census classifies 87% of Utah's population as urban compared to 75% of the nation's. A person is considered urban if they live in an urbanized area (Utah has four: Logan, Ogden, Salt Lake City, and Provo-Orem) or a city over 2,500 persons. Other Federal and State agencies, local officials, and private groups may use the same terms to identify areas based on different criteria.

Density. Utah is considered one of the least densely populated states in the country. Population density indicates the number of persons per square mile in a given geographic area. It is calculated by dividing the square miles of land area by the area's total population. In 1990, Utah had 21 persons per square mile. In 1997, Utah has 24.9 persons per square mile. Salt Lake County at 1,126.4 persons per square mile, and Davis County, at 736.6, are the most densely populated counties in the state. Weber, Utah and Cache counties are the next most densely populated counties. These five counties are significantly more densely populated than the rest of the state. After these five, Washington is the most densely populated county. At 0.9 persons per square mile, Garfield is the least densely populated county.

Utah's population density is affected by the extensive land ownership of the federal and state governments, which impacts how and where population development can occur.

¹ The Wasatch Front can also refer to a multi-county district which is comprised of Salt Lake Davis, Weber, Morgan and Tooele counties.

Approximately one-third of the land in the United States is federally-owned. The federal government owns almost two-thirds (63%) of Utah's land area. Alaska and Nevada are the only two states with a higher percentage of federal ownership. Further analysis of federal- and state-owned land may be found in reports published by the Governor's Office of Planning and Budget.

Conclusion

Utah is demographically unique among states for a variety of reasons, all of which tend to reinforce what is perhaps the hallmark of its demographic profile—a rapid population increase. Utah's population is younger and lives longer, has a higher fertility rate and more persons per household than the nation as a whole. This unique demographic profile plays an important role in understanding the state's economy. *

*In 1996, the Utah Population Estimates Committee changed its convention on rounded estimates so that it now publishes unrounded estimates. Accordingly, the estimates for 1995, 1996 and 1997 are not rounded.

**Previous to 1995, net migration figures are based on rounded population estimates to maintain consistency with the historical database. The migration estimates may differ from those found elsewhere in the report.

***From 1952 to 1970 fiscal year births and deaths are estimated by averaging calendar year births and deaths in the two years that are partially covered by each fiscal year. From 1971 to 1997, actual fiscal year births and deaths are shown.

(r)=revised
(p)=preliminary

Note: Prior to 1995, totals may not add due to rounding.

*In 1996, the Utah Population Estimates Committee, changed its convention on rounded estimates so that it now publishes unrounded estimates. Accordingly, the estimates for 1995, 1996 and 1997 are not rounded.

(e)=estimate

Note: Modified Age, Race and Sex (MARS) data were used for the analysis because these data have adjusted the census race categories to eliminate "Other race", divided the Hispanic/non-Hispanic population by race so that Hispanics can be added to the race statistic and adjusted the 1980 and 1990 census data for errors in age reporting, especially in the 0-2 ages.

Sources: U.S. Bureau of the Census, MARS data by county, Utah, 1980 and 1990. Provisional 1994 estimates were derived by Utah Department of Employment Security with review from Governor's Office of Planning and Budget.

1 Effective December 30, 1997, Midvale City's boundaries will change dramatically due to a large annexation. The population effect of this annexation is not reflected in these estimates. The Utah Population Estimates Committee has estimated Midvale's July 1, 1996 population with the annexation to be 26,778.

2 The city of Taylorsville incorporated on July 1, 1996. The Bureau of the Census will not produce a population estimate until the summer of 1998. The Utah Population Estimates Committee estimated Taylorsville's 1994 population to be 53,876 and the 1996 population to be 56,523.

3. Eagle Mountain incorporated on December 4, 1996. The Utah Population Estimates Committee estimates the town's 1996 population to be 148 persons. The Bureau of the Census will not produce an estimate for Eagle Mountain until the summer of 1998.

Source: U.S. Bureau of the Census

Employment, Wages, Labor Force

Overview

Utah's employment growth rate slowed again in 1997. Expansion in the number of nonfarm jobs, at 4.4% in 1997, is down slightly from the 1996 rate of 5.1%, which was down from the unusually rapid 6.2% growth of 1994. This year is the tenth in the series of consecutive annual job expansions of 3% or greater. The longest previous string since 1950 was only four years. By comparison, the U.S. 1997 job growth rate was 2.2%. In 1997, Utah added 42,000 net new jobs and continued to rank as one of the fastest-growing states in the nation.

1997 Summary

Joblessness Drops. In keeping with Utah's robust economy, the unemployment rate dropped from 3.5% in 1996 to 3.2% in 1997. The jobless rate has not been so low since 1952. This is the fifth consecutive year that Utah's unemployment rate has been below 4.0%. An average of 33,000 individuals were out of work during 1997, 5% fewer than in 1996.

Job Growth in All Industries. One of the strengths of Utah's economy is the diversity of its industry. Moreover, during this present expansion, most industries have gained new jobs at a fairly rapid rate. In 1997, the rate of job growth in Utah's major industrial divisions ranged from 2.6% in government to 8.5% in construction.

Construction Industry. After six consecutive years of double-digit job growth rates, Utah's construction industry has finally begun to slow its expansion. Nevertheless, job growth in 1997 was 8.5%, still very rapid. Approximately 5,100 net new jobs were created in this industry in 1997. Residential building slowed, but several large nonresidential projects picked up the slack.

Manufacturing. Like construction, the manufacturing division's growth spurt slowed in 1997 from the previous two years, which averaged 5.2%. Even so, its 3,200 net new jobs, representing a growth rate of 2.5%, is very rapid compared to the minimal expansion of U.S. manufacturing positions. Employment increases in durable-goods industries out-paced those of nondurable goods manufacturing.

Transportation/Communications/Utilities.

Transportation/communications/utilities added 2,200 new jobs in 1997 for a moderate growth rate of 4.0%. This division's component industries, with the exception of railroads and non-communications utilities, generally contributed to this expansion.

Trade. The trade division's job growth has also slowed from its breakneck 7% pace of 1994 and 1995. Creation of 9,500

jobs in 1997 registered a growth rate of 4.1%, off slightly from the 4.6% pace of 1996. Robust expansion in this division is often followed by sluggish growth as new businesses seek to sustain their viability in the face of a slowing economy and fierce competition. Wholesale trade and retail trade both grew at the same rates, a relatively unusual occurrence. Retail trade's job growth was generally broad-based, with miscellaneous retail stores and auto dealers/service stations clearly leading the pack.

Finance/Insurance/Real Estate. The finance/insurance/real estate division has been on a roller-coaster ride. Its component industries have experienced peaks and slumps associated with the overall economic expansion, their own evolutionary changes, and new employment centers locating in Utah. In 1997 the division's employment increased by only 1,600, a 3.1-percent expansion. By comparison, growth was a rapid 6.0% in 1996, while the 1995 and 1994 figures were 3.9% and 10.9%, respectively.

Services. The services division created 16,100 new jobs during 1997 for a growth rate of 6.3%. The diverse industries in this category generally expanded at a moderate pace, with computer-related services and other business services (largely "help-supply" and telemarketing firms) growing by roughly 10%. Combined, these two industries created roughly 8,000 new jobs this year, about one-fifth of all new jobs in the state.

Public Sector. Government employment in Utah has been increasing slowly for the past several years due primarily to federal defense job cutbacks, which have about ended. Thus, the 1997 increase in public employment, at 2.6% (4,300 jobs), is the largest since 1990. Federal defense and non-defense employers experienced minor cutbacks totaling a loss of less than 1%. Both state and local governments job growth accelerated from the pace of recent years. State employment increased by 1,600 jobs, while local government added about 3,000 positions.

Wages on the Upswing. In 1997, Utah's average annual nonagricultural pay was \$25,190—up 4.1% from the 1996 average, which also increased by 4.1%. This is the third year in a row that average wage increases in Utah have outpaced increases in inflation, as measured by the U.S. Consumer Price Index (CPI-U). Despite a sound economy, growth in wages for Utahns covered under unemployment insurance laws has not kept pace with national wage increases. Utah annual pay as a percentage of U.S. annual pay has declined from a high of 96% in 1981 to a low of 84.4% in 1993. Since then, Utah's annual pay has been gaining some of the lost ground, increasing to 84.9% in 1996.

The loss of high paying goods-producing jobs in the early

and mid-80s helped contribute to the decline. However, Utah's demographics may also play a part. Utah has a large percentage of young people in the labor market and a younger labor force. Young people are usually paid less than older workers. In addition, Utah also has a higher percentage of individuals working part-time than the U.S. in general, which also tends to pull the average wage down.

Major Employers. With roughly 19,000 employees, the State of Utah ranks as the largest employer. Six of the next seven top employers provide educational services. The University of Utah (including the University Hospital) and Brigham Young University each have roughly 15,000 employees. Granite, Jordan, and Davis school districts each have between 6,000 and 8,000 workers. Hill Air Force Base also falls in this interval, occupying the number six rank. A multi-county telemarketing company (Matrix Marketing) and a producer of automotive airbags (Autoliv Inc., once known as Morton International) round out the top ten largest employers. The U.S. Postal Service and the Internal Revenue Service, Salt Lake County government, major retail chains, additional large school districts, Delta Airlines, United Parcel Service, and Icon Health and Fitness also occupy a strong presence in the Utah economy.

Labor Force Composition. An average of 71% of the State's civilian, noninstitutionalized population over the age of 16 participated in the labor force in 1996. This participation rate ranks significantly higher than the national average of 67%. Both Utah women and men take part in the labor market at a higher rate than their national counterparts.

One reason for Utah's high labor force participation is the young population. Young people are most likely to work. Plus, Utah's young people are much more likely to work than U.S. teenagers in general. Utah's teenage (16-19 year-olds) participation rate generally runs more than 15 percentage points above the national average. In addition, Utah's relatively large families and lower than average wages may require families to have more than one wage earner. These factors, coupled with Utahns' relatively higher education levels, largely account for the difference between Utah and U.S. participation rates.

Roughly 97% of Utah workers are employed in nonagricultural industries. Agriculture accounts for about 3% of experienced workers, while about 7% of Utahns are self-employed nonagricultural workers. Thus, about 90% of employed people are nonagricultural wage and salaried workers.

Unemployment. About 37% of Utah's 34,700 unemployed in 1996 had lost their jobs, compared to 33% in 1995. On the other hand, job leavers were relatively fewer in number, 16% in 1996 compared to 18% in 1995 and 23% in 1994. Re-entrants leveled off at 42%, for which there are two possible explanations. Perhaps the state's reserve labor

force is diminishing, or Utah's strong economy enables people to move directly from out-of-the-labor-force to employment without a period of unemployment. Only about one-twentieth of unemployed workers were new entrants compared to one-tenth in 1994.

Occupational Composition of Utah Jobs. Occupational estimates and projections are produced for some 700 specific job titles. These are summarized, for 1998 and 2003, into eight job categories. The largest job category, both in terms of employment and the number of job titles, is the production, operating, and maintenance group. Over one-fourth of all employment in Utah is accounted for by this category. These jobs are commonly called "blue collar" and contain all the skilled crafts along with many semi-skilled and unskilled occupations. The professional job group makes up about 16% of all employment with the occupations requiring training at the Bachelor's or higher levels. Significant titles include accountants, engineers, teachers, nurses, and others. Three of the eight occupational categories each claim a 13 to 15% slice of the employment pie. These are sales, clerical, and service job categories. The managerial and administrative group represents about 8% of total employment with the technical and agriculture related categories at 5% and 3% respectively.

Employment Trends in Occupations. The future for occupations in Utah can be viewed in two lights. First, by the growth rates for occupations and occupational categories, and second by the occupations' change in the "share" of total employment.

Professional, technical, managerial, and service jobs are growing at the fastest rate. Each of the job groups will enjoy a 2.9% to 3.2% per year rate of growth over the 1998 to 2003 period. The average for all occupations and industries for the same period is 2.5% per year. Clerical, agriculture-related, and production, operating and maintenance categories will fall well below the 2.5% average with rates of 1.7%, 1.3%, and 1.9% respectively. Important to note is that two (professional and technical) of the three categories with the fastest growth also require a substantial educational investment.

In terms of the share of total employment, managerial, professional, technical, sales, and service occupations will experience an increased share in total employment from 1999 to 2003. Those that will be "losing share" of total jobs are the clerical, agricultural-related, and the production, operating and maintenance job titles. These structural changes are gradual and account for less than a 1% change over the projections period, but they do reflect the changing structure of the labor market.

The Measure of Demand - Job Openings. The growth of employment in an occupation provides only a portion of the true measure of labor demand in the labor market. Job

openings also result from the need to replace workers who leave current employment positions for another occupation or who leave the labor force. These two components comprise the demand for an occupation. An average of about 60,000 of these vacancies will occur each year over the 1998 to 2003 period. Of the 60,000, over one-half will be due to growth in the labor market with another 28,000 caused by the need to replace current workers.

The production, operating, and maintenance job category will provide the largest number—13,200—of job openings each year, followed closely by the professional, service, and sales occupational groups which will each add another 10,000 openings annually. These four categories will account for three out of every four job vacancies. The clerical group will contribute about 7,000, or 12%, of the total with the technical adding another 2,800 and the agricultural group with about 1,100 vacancies.

Utah Jobs and Educational/Training Requirements. Of the roughly 138,000 vacant employment positions in 2003, about 21.8% will require a Bachelor's degree or higher. Those jobs that call for associate degrees of applied technology training will account for about 9% of the total, while another 9% of total jobs need work-related experience. On-the-job training (including some formal classroom time) of one year or longer will account for about 11% of the total; jobs classified as moderate term (from one month to one year) on-the-job training add up to 12%. The largest group of all, containing semi-skilled and unskilled jobs (those that require less than a month of training), claim 36.8% of total jobs.

The Utah Job Outlook, available from the Utah Department of Workforce Services, reports the projections of employment by occupation for Utah. Projections identify the occupations in demand over the 1998-2003 period in Utah

and each of the nine substate districts.

Significant Issues

Labor Shortages. Although job growth in Utah was well above average for 1994 through 1996, while 1997 was only slightly faster than average, labor shortages seem to be a continuing problem in the metropolitan counties and in certain occupations. Unfortunately, it is difficult to quantify labor shortages because there is not a system of reporting or measuring these conditions. Nevertheless, several signals indicate their existence. Comments from employers and state government representatives who are in contact with employers point to shortages of highly technical computer specialists, telemarketing workers, retail sales workers, and, in season, certain construction occupations. The industries employing these occupations have grown rapidly for several years. Workers in these positions are known to "job-hop" to obtain higher wages. Affected employers have raised wages or have introduced employee attraction and/or retention techniques. A result of this phenomenon is that new firms are becoming more cautious about relocating to these areas.

One of the anticipated results of labor shortages is rising wages. And wages in affected occupations do seem to be increasing more rapidly than usual. This may be reflected in the relatively rapid growth of Utah's 1995 through 1997 average wages.

Conclusion

Utah's economy is in excellent condition. Its unprecedented economic expansion seems to be leveling off to around the state's long-term average. Most industries are prospering. Unemployment is at a 45-year low and wages continue to outpace inflation. ✱

Personal Income

Overview

Utah's 1997 total personal income is forecast to be \$42.5 billion, up 8.3% from the 1996 total.¹ The state's 1997 total personal income increased considerably faster than the forecasted U.S. growth of 5.8%. Utah's 1997 per capita income is estimated to be \$20,750, an increase of 5.8% over the 1996 estimate. Utah's 1996 per capita income ranks 44th among the states, but Utah's relative ranking improves considerably when adjusting for the young population.

1997 Summary and 1998 Outlook

Utah's 1997 total personal income (TPI) is forecast to reach \$42.5 billion, up 8.3% from the 1996 total, which increased 8.4% from the 1995 level. Utah's 1997 TPI grew considerably faster than the forecasted national TPI growth of 5.8%. The relative strength of Utah's ongoing economic expansion is clearly reflected in these TPI growth comparisons.

Per capita personal income is an area's annual total personal income divided by the total population as of July 1 of that year. Utah's 1997 per capita personal income (PCI) is forecast at approximately \$20,750, an increase of 5.8% over the 1996 estimate. From 1989 to 1997, Utah's percentage of the national PCI has increased by 8 points (from 73% to 81%).

The gradual slowing of the growth in Utah's nonfarm jobs will likely cause its TPI growth to correspondingly decelerate. Thus, TPI expansion is anticipated to be about 7.9% in 1998. Per capita personal income for 1998 will therefore be approximately \$21,920.

Significant Issues

Composition of Total Personal Income. The largest single component of total personal income is "earnings by place of work." This portion consists of the total earnings from farm and nonfarm industries, including contributions for social insurance. In 1996 earnings by place of work reached \$30.3 billion, representing 77% of TPI. Approximately 10% of this figure was proprietors' income, while 90% was wages, salaries, and other labor income. Nonfarm earnings (\$30.1 billion) was 99% of total earnings; farm income comprised less than 1%. Private sector nonfarm industries accounted for 83% of nonfarm earnings, while earnings from public (government) industries made up 17%. Although earnings from government employment have been declining as a share of Utah's total earnings, it is still relatively more important than the U.S. share (16.8% to 15.2%, respectively).

¹Total personal income is defined as all income received by all residents of an area.

The other components of TPI are dividends, interest, and rent (DIR); and transfer payments. In 1996, DIR amounted to \$5.5 billion, and transfer payments were \$5.4 billion. Some of the major differences between the economic compositions of Utah and the United States lie in these two parameters. Perhaps the most significant is that Utah DIR comprise a much smaller (13.9% versus 18.1%) share of TPI than the national figure. Transfer payments are also relatively smaller. Thus, Utahns must rely to a greater extent on earnings. The problem with this is that Utah's average wage is only 85% (in 1996) of the U.S. average. Due to these two factors, Utah's TPI is relatively lower than the national total personal income.

The industrial composition of Utah's TPI has changed in recent years. In 1980, prior to the last two recessions, goods-producing industries (mining, construction, manufacturing) generated over 31% of Utah's total earnings. By 1992 that share had dropped to 22.9%, but it had increased to 24.4% by 1996. By comparison, 24.5% of U.S. earnings are from goods-producing jobs.

Four major industry sectors generate over three-fourths of Utah's total earnings. Services is the leader, providing 27% of earnings; government (including military) pays 17%. Both manufacturing and trade (wholesale plus retail) account for roughly 16% of Utah's total earnings. Following these are transportation/communications/utilities and construction both at 8%, finance/insurance/real estate at 7%, and mining at 1.4% of earnings. Agriculture/agricultural services make up the remaining 1.0%.

Per Capita Personal Income. Utah's 1996 per capita personal income of \$19,600 ranked 44th among the 50 states, a substantial improvement over the ranking of 49th only a few years ago. During the 1970s, Utah's PCI ranged between 81% and 83% of the United States' PCI. However, from 1977 to 1989, this parameter dropped ten percentage points--from 83% to 73%. All the following years--1990 through 1996--experienced improvements in this comparison--the 1997 ratio, at 81.0%, is the highest level since 1979.

County Personal and Per Capita Income. Six of Utah's 29 counties (Table 38) posted double-digit 1995-1996 growth in total personal income, a modest improvement over 1995 when only four counties did so. This rapid growth is generally tied to rapid increases in nonagricultural wages, which is typically the largest component of total personal income. On the other end of the scale, another six counties, Daggett, Emery, Millard, San Juan, Uintah, and Wayne, suffered TPI expansion half or less of the state rate. This occurs because of the slow growth of nonfarm jobs.

The 1996 PCI estimates in the counties comprising the Salt Lake City-Ogden Metropolitan Statistical Area are considerably higher than those of the rest of the state, with one exception: Summit County's \$31,900 is the highest in Utah. The remaining 25 counties' PCI estimates are all lower than the state average. San Juan County's \$11,500 is lowest. The 1996 per capita income of the United States, at \$24,426, is higher than that of all of Utah's counties except Summit.

Conclusion

Utah's total and per capita personal income estimates for recent years comprise another important indicator of the strength of Utah's economy. Both of these parameters have been increasing at a more rapid rate than comparable national figures. However, Utahns are generally more dependent on earned income than the national average. And, since the average annual pay of Utah workers is somewhat lower than the U.S. average, Utah's total and per capita personal income are relatively lower. *

Gross State Product

Overview

Utah's 1997 gross state product is estimated by Regional Financial Associates to be \$47.2 billion. The most recent estimate of gross state product for Utah released by the U.S. Bureau of Economic Analysis is for 1994 and shows Utah at \$41.7 billion.

Gross state product is the market value of the goods and services produced by the labor and property located in a State. It serves as a regional counterpart of national Gross Domestic Product. GSP is calculated by subtracting intermediate inputs from gross output. When measured, GSP is generally presented in both real and current terms. Real GSP is an inflation-adjusted measure of each state's output based on national prices for goods and services produced within the State. It is not however, a measure of the cost of goods and services consumed in the state. The current dollar measure of gross state product on the other hand is used to measure the relative size of a state economy at a given point in time. Current dollar comparisons allow interested parties a chance to view an industry's claim on state resources and determine if this claim is increasing (or decreasing) over time.

1997 Summary

Inflation-Adjusted Gross State Product. Utah's gross state product in inflation-adjusted terms has been increasing since 1987. In fact, according to the most recent GSP release of the Bureau of Economic Analysis, the six western states of Utah, Nevada, Idaho, New Mexico, Oregon, and Washington led the nation in growth in real gross state product from 1987 to 1994 as demonstrated in Table 40. The fastest growing sectors in the western states were construction and wholesale trade. Utah also experienced significant increases in the service sector. Data after 1994 is not yet available through BEA. The average annual rate of change for Utah over the 1987 to 1994 period was 4.2%, making Utah the fourth fastest growing state in real terms.

Current Dollars Gross State Product. Regional Financial Associates provides current (not adjusted for inflation) GSP

estimates for Utah. The most recent estimates for 1995, 1996 and 1997 at \$41.9, \$43.9, and \$47.2 billion respectively, demonstrate that gross state product growth continues to remain strong. In 1994, private industry accounted for 84.02% of Utah's gross state product, while government accounted for 15.99%. The change in the industry mix from 1980 to 1994 is seen in Figure 22.

1998 Outlook

The Regional Financial Associates estimate of GSP for 1998 is \$49.8 billion in current dollars.

Significant Issues

Several major improvements have been incorporated into the new and revised estimated of GSP released in June 1997 including the following:

- ✱ Chain-type measures of real GSP, which reduce the substitution bias that is inherent in the previously used fixed-weighted measures.
- ✱ A new treatment of government investment, which provides a more complete picture of investment through the consistent treatment of investment in both the public and private sectors.
- ✱ Additional State source data on sales, on sales taxes, and on gross receipts taxes, which result in better allocations of national commodity taxes by industry.
- ✱ State data on receipts and payrolls for industries newly covered in the 1992 economic censuses.

The most recent revised GSP estimates for Utah are presented in the tables.

Conclusion

Gross State Product can be used to measure aggregate production in a state. For Utah this aggregate production has shown solid increases over the past ten years. This growth should continue into the future. GSP can also be utilized to show the change in the industry makeup over time and as such can prove useful in monitoring the diversity in the economic structure of Utah. ✱

Gross Taxable Sales

Overview

After four consecutive years of between 9% and 12% growth, taxable sales¹ are expected to rise less than 5% in 1997 and then turn up again to just under 8% growth in 1998. Taxable sales include three major components. These components and their 1997 values include:

- ✦ Retail Trade at \$15.2 billion, represents about 56%, and increased by about 5%
- ✦ Taxable Business Investment and Utility Sales at \$7.2 billion, represents 26% of taxable sales, and increased by just under 5%
- ✦ Taxable Services at \$3.7 billion, representing 14% of taxable sales, increased by less than 3%

1997 Summary

Retail Trade. Between 1992 and 1996 retail trade rose in double-digits in four of the five years (Table A). Even in the one year of below 10% growth, retail sales rose 8%. An end to these high growth rates occurred during 1997. Year-to-date growth appears to be in the 3% to 4% range, while year-end growth is estimated to be close to 5%.

Durable Goods. Most of the slack has been felt in durable goods sales. During the residential construction boom of the early 1990s, construction related sales jumped 60% from \$2.77 billion to \$4.44 in only three years. Even in 1996 durable goods sales rose another 12% to \$5.36 billion. More than 20% quarterly declines in residential construction permit values in early 1997 spelled declining growth rates and actual declines in one of the retail durable goods sectors. Building and garden store sales are expected to fall 2% this year as the demand for lumber and building materials has fallen rapidly. Furniture and home furnishings, partially due to the lag in permit values and new construction purchases, rose nearly 20% in 1996, despite the fact that permit values began to ebb. But the construction cycle finally worked its way into furniture store sales in 1997—they grew only 2% in 1997.

Motor vehicle sales have experienced similar volatility. While lower interest rates is certainly one similar factor, vehicle stocks, dealer incentives, new leasing and financing techniques, consumer confidence and current job growth are also important economic drivers. Pent up demands were fulfilled by 1994 after 12%, 20% and 9% growth rates occurred in 1992, 1993 and 1994. Motor vehicles sales then moderated in 1995 rising only 4%, then rebounded to a 12% growth rate in 1996. In 1997, motor vehicle sales increased

about 3% to almost \$2.8 billion. Unit sales of cars and trucks increased by an estimated 85,000 units in 1997, an increase of 3%. Dealer incentives, which rose to near record levels in 1996, leveled off in 1997, offering no additional boost to car sales. A portion of the drop in sales may also be a data problem caused by industry reclassifications. Vehicle sales are expected to bounce back 6% in 1997 due to 1) strong average wage growth, 2) lower interest rates, 3) continued high consumer confidence, and 4) the end of the reclassification effects.

Nondurable Goods. Nondurable goods sales rose an estimated 6% in 1997 to \$9.7 billion. These sales represent more than one-third of the \$27 billion in total taxable sales. They include goods which last generally less than three years, consisting mainly of food, household nondurable goods, and clothing. Year-to-date sales in nondurables are rising only at a 5% rate, but Christmas sales are expected to boost year-end sales an additional 1 or 2 percentage points. General merchandise and apparel store sales increased by 7%. Food store sales increased 11%, due in part to the above-mentioned reclassification effect. Eating and drinking place sales increased 7% in 1997. After several years of double-digit sales, miscellaneous shopping store sales leveled off to only a 2% gain in 1997. These sales include drug, sporting, camera and gift store, as well as the fast-growing nonstore retailers. Unless there have been serious structural changes in 1997, these sales should rebound in 1998.

Business Investment and Utility Sales. A mixture of new telecommunications products, a construction boom, and strong manufacturing and mining investments combined to boost business investment over the past four years. Between 1992 and 1996 business investment rose from \$4.34 billion to \$6.88 billion, an increase of 58%. The largest share of the increase occurred in the wholesale trade sector. Final sales of equipment are taxable and almost \$3 billion will be sold by wholesalers to consumers and businesses across the state in 1997. A good share of these sales are sold from out-of-state vendors to Utah businesses and taxed under Utah's use tax provisions. Another significant share is sold to consumers in the form of final retail sales, despite the fact that the sellers also wholesale goods to businesses. Prominent consumer sales include truck (only) dealers and electrical goods store sales which are categorized in the wholesale area. The downturn in residential construction mixed with a legislative exemption for replacement parts to manufacturers has combined to limit wholesale sales to a 3% to 4% growth rate in 1997. The same two factors have led to a 7% decline in manufacturing investment purchases. Next year, wholesale sales are expected to jump almost 12% as construction growth, particularly nonresidential expands. Manufacturing purchases may continue to decline

¹Gross taxable sales consist of final sales of most tangible personal property in the state. Taxable sales of selected services such as hotel and lodging; leases, rents and repairs to tangible personal property; and admissions to most amusements and recreation activities are also taxable in Utah.

in 1998 as the normal operating equipment replacement exemption expands to 100% on July 1, 1998.

Taxable mining investment (a volatile mix of copper, oil and gas, and coal equipment purchases) increased about 50% in 1997. Mineral resource producers apparently are investing in equipment with improved technologies. Relatively low interest rates, a surge in stock prices, and the resulting capital liquidity and increasing international competition have probably influenced investment decisions. Investment is likely to decline in 1998 to historically strong levels.

Although public utility sales have been lackluster in 1997 due to the relatively mild 1996-97 winter temperatures, an increase in natural gas prices offset price declines in electricity. Deregulation has compressed marginal prices in the communications sectors, but surging new telecommunication products (such as mobile phones, pagers, fax machines, home-based satellites) have bumped taxable sales, which increased by an estimated 12% in 1997.

Some economists, who specialize in nonresidential business equipment, think the near-term outlook looks brighter than consensus forecasts because the depreciable lives of much of the equipment has been rapidly narrowing in the past five years. Computer and data processing equipment, which comprises between 40% and 50% of this sector, has a life of between three to five years. Big microchip makers must replace about two-thirds of equipment every three years.

Taxable Services. Taxable services have also risen at near break-neck speeds in Utah's economic expansion. Between 1990 and 1996 taxable services doubled from \$1.8 billion to \$3.6 billion. In 1997, however, taxable services increased by grow less than 3%.

The only subsector refusing to pause in 1997 are amusement and recreations sales, which continue to grow at a 9% clip. A successful professional basketball season and strong movie theater and amusement park sales combined to create another profitable year. Legislative changes in 1994 added about \$80 million to the taxable services base. Amusement sales are expected to be strong in 1998.

Business services declined by 3% in 1997. Computer and data processing sales dropped by an estimated 12% and 24%. The large miscellaneous business services sector also experienced declines in 1997.

The largest subsector, auto rentals, repair and other repair shop services increased by 5% in 1997. This follows four consecutive years of double-digit growth. Auto rentals, most closely correlated to tourism increased 10% in 1997. Auto repair, which sometimes runs counter cyclical to new car sales, increased 2%. Sales in this sector should rebound to average growth rates next year.

Another sector which has experienced strong growth in the early 1990s are taxable leases and sales within the finance, insurance and real estate group. For the most part, most of the taxable sales here comprise automobile leasing (banking), rentals and leasing of large household durable items such as televisions and furniture (credit agencies), and leases of condominium (real estate). Taxable sales and leases in this sector have risen three-fold from \$79 million in 1990 to \$318 million in 1996. A good portion of this phenomenal increase is due to the share of vehicle sales which are leased versus purchased. Nationally, leasing has risen from 7.5% in 1990 to more than 32% of all vehicle sales in 1997. After a 3% growth pause in 1997, this sector should rebound 12% in 1998.

Outlook

The Utah Consumer. Almost 70% of taxable sales are paid initially by the Utah consumer. The economic health of the consumer drives most of the sales made in Utah each year. The best gauge to measure consumer spending in Utah is nonfarm wages and salaries. In 1997, wages are expected to climb 8.7%, 0.7% less than in 1996. This reduction was entirely due to the slip in nonfarm employment growth from 5.1% to 4.4% in 1997. A similar drop in job growth is forecasted in 1998 as it shrinks to 3.6%. In contrast, average wages are expected to grow a constant 4.1% per year from 1996 through 1998. While these small declines will take a toll on wages and salaries, a decline in inflation from 2.4% in 1997 to 2.2% in 1998 may turn into a real dollar gain for wages and salaries.

Another factor relevant to the Utah consumer in 1998 is consumer confidence. Record highs were achieved in 1997. Additional highs will probably be duplicated in 1998 due to lower interest rates, less inflation, continued low unemployment rates and concomitant increased demands for qualified employees. In addition, lower interest rates have spawned a resurgence in refinancing that will increase disposable income in the consumer's pocket.

Demographic trends will also play an important role in Utah consumer spending behavior over the near term. The baby boomlet, which includes those born from 1976-79, continues to impact taxable sales. Between 1990 and the year 2000 the 15 to 19 year old cohort will increase from 153,000 to 195,000, a gain of 27%. Even more spectacular is the gain in the 20 to 24 year old cohorts, which will increase from 138,000 in 1990 to 208,000 in 2000, an increase of 50%. Since most of the gain lies within these five-year cohorts, even greater gains can be found if one examines further. The "baby boomlet" or "echo baby boom" may not have an impact on overall spending, but will impact how that dollar gets spent. As soon as these young people get jobs they will start looking for automobiles, electronics and clothing. After breaking from their parents, they will start demanding apartments and condominiums. Five to seven years from now they will place demands on new single family home construction.

Investment in Plant and Equipment. The outlook for plant and equipment investment looks strong for 1998. The third quarter 1997 real gain in U.S. nonresidential fixed investment was more than 20%. Several factors support this view:

- * A shortening of the depreciable lives of capital equipment (as computers become a larger share of investment) in the past five years forces companies to reinvest more frequently
- * The influx of capital from stock market gains
- * The increase in the ability of manufacturers to finance projects through commercial paper
- * Strong profitability enables more investment
- * The upgrading of communications equipment, from coaxial cables to satellite dishes
- * Continued globalization which increases competitive pressures to reduce costs
- * Relatively low wages in Utah stimulates investment here rather than on the West or East coast
- * Lower interest rates in 1998 lowers the cost of capital

There are only two negative factors in the horizon. Corporate profits are being squeezed but will remain constant at relatively high levels. The expansion of the manufacturing equipment exemption to 100% on July 1, 1998 to exempt all normal operating replacements with at least a 3-year life will gradually be taken by more and more taxpayers. This will not hurt Utah business investment, but will cut into taxable sales.

Tourism. After several years of brisk growth, selected aspects of the tourism industry slowed down in 1997. National park visitations rose only 4%. Salt Lake International Airport passenger arrivals and departures fell from double-digit advances to only a 1% gain in 1997. Hotel/motel occupancy rate dropped from 73% to 74% levels in 1994 through 1996 to 71% in 1997. The effects of this softening left its mark on taxable sales. Restaurant sales increased 6% in 1997, compared to average increases of 9% from 1991 to 1996. Following two years of near 12% gains in hotel sales, 1997 experienced a 4% gain. Bucking the downturn, however, were amusement and recreation sales which increased 9%. The outlook for 1998 should be brighter: hotel sales should bounce back 7%, eating and drinking place sales may approach 10% growth.

Construction. The impacts of Utah's construction boom have been well documented in this report. Notwithstanding, the effects of primarily residential construction and secondarily of nonresidential construction are difficult to overstate. Purchases by contractors, whether from vendors in or out of the state are taxable. Secondary purchases by consumers once the house is completed add to the impact. The slowdown in the purchase of construction items can be directly observed in the taxable sales of the following

economic sectors:

- * Construction - up only 3% in 1997
- * Manufacturing - off 7% in 1997
- * Wholesale Durable Goods - up less than 4% in 1997, after doubling in five years
- * Building and Garden Stores - down 2% in 1997, after more than doubling between 1991 and 1996
- * Furniture and Home Furnishing Stores - up only 2% in 1997, after rising 137% between 1991 and 1996
- * General Merchandise Stores - rising only 5% this year compared to 8% average annual gains in the past five years
- * Business Services (equipment rentals) - down 3% after rising 55% between 1991 and 1996

In the past few months residential construction permit valuations have bounced back a bit. But due to the unavailability of multi-family permits in 1998, overall valuations may fall again. Strong nonresidential construction building will boost overall construction activity, making the construction variable a slightly positive driver for taxable sales in 1998.

County Taxable Sales

Following several years of double-digit growth, taxable sales within Utah's 29 counties ebbed in 1997. Growth rates were cut in half for many counties, including Salt Lake County, whose growth rate will slow to just over five percent. Close to 5% growth rates are also expected in five out of the six next biggest counties, such as Cache, Davis, Summit, Washington and Weber. All of those, except Washington County (in Utah's southwest corner), are located along the Wasatch Front, or at least are close to the Front range. The only county which appears to have less sales in 1997 than in 1996 is Morgan County. Between 1992 and 1996, taxable sales in Morgan rose more than 12% per year due to its proximity to Davis and Weber counties in the north part of the Wasatch Front. In contrast to Morgan, Wasatch County taxable sales increased at least 12% in 1997. Wasatch County has become a Mecca of sorts for consumers of recreation and resort activities. Hotel and lodging sales were up five times their normal rate during the first half of the year. Construction purchases were up more than 40%.

Carbon County also exceeded the 1997 lower average growth rate. Its taxable sales were up almost 12% through September, due in part to strong business investment in its coal and electric industries in addition to wholesale durable goods. Very strong growth also occurred in Duchesne County. Its taxable sales increased 32% in 1997 due to a near doubling of business investment purchases. Retail sales there are also in very high double-digit growth rates. *

Tax Collections

Overview

Tax collections experienced a net reduction of \$180.6 million (on an annualized basis) due to statutory changes that occurred over the past four years. The cumulative reduction in tax collections from fiscal year 1995 through fiscal year 1999 is \$768.7 million. The 1994 general legislative session enacted a net reduction of \$18.8 million in taxes. Additional cuts during the 1995 general legislative session reduced taxes another \$141.9 million. Taxes were reduced another \$109.6 million during the 1996 general and special legislative sessions. Taxes, fines, and fees, were raised a net \$89.7 million during the 1997 legislative session primarily to fund reconstruction of Interstate 15 and other roadways.

The federal Taxpayer Relief Act of 1997 will provide tax cuts averaging about \$958 over the next five years for each Utah tax filer. This tax relief will come primarily in the form of education and child credits. State of Utah income tax collections will also increase due to the provisions of this Act. State income tax collections will increase due to one-time increased asset selling due to a lower capital gains tax rate (\$25 million); and because Utahns will pay lower federal income taxes (they will deduct fewer federal taxes paid against state income taxes owed (\$15 million).

Summary of Recent Events

1994 Legislative Session Tax Changes. Tax reductions of \$18.8 million (in 1994 dollars) were enacted in the 1994 legislative session, as shown on Table 47. The sales tax rate was reduced by 1/8th cent (\$23.6 million in 1994 dollars), and the property tax residential exemption was raised from 29.5% to 32% while the minimum school program property tax rate was lowered from .004275 to .00422 (\$8.5 million). Several sales tax exemptions were eliminated (which partially offset the tax cuts).

1995 Legislative Session Tax Changes. Another round of tax cuts during the 1995 general legislative session reduced taxes \$141.9 million (in 1995 dollars). The largest tax reduction was a \$150.1 million property tax cut. Property taxes were reduced \$141.4 million by raising the residential exemption from 32% to 45% and by lowering the minimum school program rate from .00422 to .00264. Property taxes were lowered another \$8.7 million due to newly imposed certified levy limits on state mandated property taxes. Gross receipts taxes increased \$9.4 million to offset the property tax decrease accruing to electric utilities. Other tax changes are outlined on Table 47.

1996 General and Special Legislative Session Tax Changes. The basic state minimum school program property tax rate was reduced for the third time (in as many

years) from .00264 to .002138 to accommodate another property tax cut (\$30 million in 1996 dollars). Individual income taxes were decreased (\$45 million); and the 1995 general session gross receipts tax increase on electric utilities was partially reversed through a gross receipts tax reduction (\$4.8 million).

The November 1996 special legislative session modified a manufacturing sales tax exemption bill for "normal operating replacements" that was passed out of the 1995 general session. This exemption will be phased in over three years. The sales tax exemption for normal operating replacements is phased in as follows (1) beginning July 1, 1996, 30% of the exemption is allowed; (2) beginning July 1, 1997, 60% of the exemption is allowed; and (3) beginning July 1, 1998 (fiscal year 1999), 100% of the exemption is allowed. The revenue loss from this exemption is estimated at \$28.6 million for fiscal year 1999 (when it will be fully implemented).

The 1996 general session also reduced general fund sales tax collections by \$36 million (1/8th cent) beginning in fiscal year 1998 (in 1998 dollars). This was done in order to earmark (redistribute) these taxes for water and local transportation projects. The earmarking was not a tax reduction since the 1/8th cent will be collected and deposited into a restricted account.

1997 Legislative Session Tax Changes. Taxes, fines, and fees, were raised a net \$89.7 million during the 1997 legislative session primarily to fund reconstruction of Interstate 15 and other roadways. The diesel and gasoline tax was increased 5 cents a gallon and the 1/2 cent per gallon earmarked for underground storage tanks was redirected to fund highways (\$63.3 million in 1997 dollars); vehicle registration fees were increased (\$16.5 million); a 2.5% tax on rental cars was implemented to pay for transportation corridors (\$4.3 million); the diesel fuels tax collection point was changed from dealers to refineries (\$10 million); and, cigarette taxes were increased 25 cents per pack (\$21.8 million); Finally, sales taxes were reduced by 1/8th cent which partially offsets the tax and fee increases (\$34.3 million in 1997 dollars). The details of these tax changes and the bills which enacted them are listed below.

Bills from the 1997 Legislative Session. Tax bills coming out of the 1997 legislative session included:

House Bills:

H.B. 27 Cigarettes Tax Increase and Regulation - Tanner, J. -- Increases the cigarette tax 25 cents per pack and specifies the programs on which the increased revenue can be spent. Estimated gain of revenue is \$21,800,000.

H.B. 84 Sales Tax Exemption for Employee Transportation - Swallow, J. -- Exempts from the sales tax certain employee transportation. Estimated loss of revenue is \$9,500.

H.B. 98 Local Taxing Authority - Valentine, J. -- Limits cities authority to impose business license fees as broad taxes, clarifies the authority of municipalities to tax telephone service, authorizes municipalities to impose transient room taxes, authorizes municipalities to impose additional resort community sales taxes, and allows for a 1/4th cent sales tax increase if not in a transit district. Estimated gain of revenue could be as much as \$40,300,000.

H.B. 111 Transportation Corridor Funding - Dillree, M. -- Implements a 2.5% tax on rental cars to pay for transportation corridors. Monies are deposited into the restricted Transportation Corridor Preservation Revolving Loan Fund. Estimated gain of revenue is \$4,300,000.

H.B. 124 Licensing of Day Care Facilities - Jones, D. -- Extends child care licensing requirements. Estimated revenue gain from new licensees is \$15,000.

H.B. 154 Property Tax Circuit Breaker - Short, R. -- Modifies the calculation of property tax credits allowable for homeowners and renters, and changes the maximum amount allowable as a renter's credit. Estimated loss of revenue is \$215,000.

H.B. 197 Use of Income Tax Revenues - Garn, K. -- Provides that income tax revenues shall be deposited in the Uniform School Fund except for those appropriated to higher education. No fiscal impact.

H.B. 225 Assessment on Workers' Compensation - Adair, G. -- Permits the Department of Workforce Services to impose an assessment related to the restricted Employers' Reinsurance Fund. Estimated gain of revenue is \$6,100,000.

H.B. 247 B And C Roads Formula - Stephens, M. -- Modifies the formula for appropriating Class B and Class C road funds. No fiscal impact.

H.B. 359 Endangered Species Mitigation Fund - Hatch, T. -- Creates an Endangered Species Mitigation Fund and imposes a royalty tax on brine shrimp harvesting. Estimated gain of revenue is \$400,000.

H.B. 413 Sales Tax Revenues to Transportation Funding - Fox, C. -- Diverts the state's 1/64th cent sales tax currently earmarked for Olympics facilities to state roads after the tax has raised \$59 million for the facilities. Monies are deposited into the restricted Centennial Highway Trust Fund and as such are not shared with local governments. However, counties, cities, and towns are allowed to retain their local 1/64th cent sales tax after Olympics funding has ceased. Estimated gain of revenue to the state is \$4,200,000.

H.B. 414 Registration Fee on Vehicles - Valentine, J. -- Increases the vehicle registration fee by \$10 and trucking fees by about 10%. Monies are deposited into the restricted Centennial Highway Trust Fund and as such are not shared with local governments. Estimated gain of revenue is \$16,500,000.

Senate Bills:

S.B. 26 Sales Tax Option for Counties - Mansell, L. -- Authorizes a county-option sales tax of 1/4th cent which must be offset by property tax reductions, requires the counties to hold public hearings on such a tax, and provides procedures for distributing revenue generated by the tax. Shifts up to \$56,368,000 from property taxes to sales taxes.

S.B. 29 Sales Tax Exemption for Scrap Recyclers - Buhler, D. -- Provides for a sales tax exemption for manufacturing equipment purchased by scrap recyclers. Estimated loss of revenue is \$79,900.

S.B. 36 Income Tax Energy Savings Tax Credit Extension - Evans, R. -- Reauthorizes the income tax credit for energy saving systems and modifies the maximum amounts allowable as credits for residential and commercial energy systems. Estimated loss of revenue is \$27,000.

S.B. 41 Coal Tax Credit - Dmitrich, M. -- Authorizes a tax credit for exported Utah steam coal for an additional five years. Estimated loss of revenue is \$250,000.

S.B. 50 Sales Tax Refund On Donated Food - Stephenson, H. -- Provides a sales tax refund for pounds of food donated to qualified emergency food agencies. Estimated loss of revenue is \$86,500.

S.B. 139 Clean Burning Stove Tax Credit Amendments - McAllister, L. -- Extends the number of years for which a tax credit is allowed regarding purchase of wood or pellet-burning stoves. Estimated loss of revenue is \$35,000.

S.B. 161 Motor Vehicle Compliance With Insurance, Registration, And Sales Tax Requirements - Peterson, C. -- Amends certain uses of the information in the Uninsured Motorist Identification Database. Monies are deposited into a restricted fund and as such are not shared with local governments. Estimated gain of revenue is \$870,000.

S.B. 243 Bonds for Highway Funding - Hillyard, L. -- Authorizes bonds for Utah's \$2.6 billion highway funding project; exempts bonding for these highways from the state's spending limitation statute; imposes a backup property tax for the repayment of bonds if funds from other sources are insufficient to cover obligations; mandates that all interest income from bond sinking fund investments be used for the payment of debt service on the bonds. Bonding can be up to \$600,000,000, but can not exceed \$350,000,000 in FY 1998 and FY 1999.

S.B. 251 Uniform Fees on Tangible Personal Property - Peterson, C. -- Decreases the property tax on motor vehicles from 1.7% to 1.5% or by about 12%. Passage of this bill will decrease the property taxes paid by vehicle owners by approximately \$16,300,000. The net effect will be revenue neutral, however, because there will be a corresponding increase in the other property tax rates.

S.B. 252 Collection of Fuel Tax - Stephenson, H. -- Changes the point of collection for the diesel fuels tax from dealers to refineries and terminals. Requires exempt users to apply for a refund as is done with gasoline. Monies are deposited into the Transportation Fund and as such are shared with local governments. Estimated gain of revenue is \$10,000,000.

S.B. 253 Sales Tax Reduction, Fuels Taxes, and Repeal of Environmental Surcharge on Petroleum - McAllister, L. -- Raises the diesel and gasoline tax 5 cents a gallon and reduces the sales tax by 1/8th cent. Monies are deposited into the Transportation Fund and as such are shared with local governments. Enactment of this bill will generate \$63,250,000 in increased revenue to the Transportation Fund due to the 5 cents increase in the gas tax and the additional 1/2 cent diversion from underground storage tanks to highways. There will be a decrease in General Fund sales taxes of \$34,300,000 due to the sales tax reduction. Estimated net gain of revenue is \$28,950,000.

Outlook

Employment growth, residential construction, in-migration, and overall economic activity should moderate in fiscal year 1998. The outlook for fiscal year 1998 revenue collections should also moderate to around 6.3%. This growth rate is lower than the average annual rate of 8.0% for fiscal years 1980 through 1998. This lower growth rate occurs despite increases in cigarette and motor fuels taxes. The reason for the decline in the growth rate for fiscal year 1998 revenue receipts is due to unrestricted general fund sales tax losses of \$78 million.

General fund (unrestricted) sales tax collections were reduced by \$36 million (1/8th cent) beginning in fiscal year 1998 in order to earmark (redistribute) these taxes for water and local transportation projects. Although this earmarking was not a tax reduction (since the 1/8th cent will be collected and deposited into a restricted account) it did reduce free (unrestricted) revenues deposited into the general fund. General fund free revenues were further reduced by \$33 million due to a 1/8th cent cut in the sales tax rate. (The tax cut in fiscal year 1988 was not the full \$36 million due to a one month delay in collections). Finally, unrestricted sales tax revenues decreased another \$8.7 million due to an increase in the manufacturing exemption from 30% to 60%.

Significant Issues

Budgetary Reserve Account and Permanent School Trust Fund. The State maintains a Budgetary Reserve

Account (the "Rainy Day Fund") which can only be used to cover operating deficits or retroactive tax refunds. Established by the legislature in fiscal year 1987, this fund can retain a maximum of 8% of the general fund appropriation for the year. The "Rainy Day" balance at the end of fiscal year 1997 was \$79.4 million. The fund's current maximum allowable level is \$116.1 million.

The permanent School Trust Fund was established via a constitutional amendment in fiscal year 1988. Prior to fiscal year 1988 school trust land monies were deposited into the uniform school fund as a funding source for public education budgets. Only real (inflation-adjusted) interest earnings from the permanent fund are currently deposited into the uniform school fund. The permanent fund balance at the end of fiscal year 1997 was \$130.2 million. This fund does not have a maximum allowable limit.

Twenty-five percent of the Budgetary Reserve Account (Rainy Day Fund) is earmarked to cover public education operating deficits. Voter approval of Proposition No. 6 in November 1996 amended the state constitution to allow for income tax monies to be used to fund higher education.

State Appropriations and Tax Limitation. Appropriations from tax collections are limited by the "State Appropriations and Tax Limitation Act". This law limits state appropriations from the general fund, uniform school fund and transportation fund based upon a formula that reflects the average of changes in personal income and the combined changes in population and inflation. Capital developments, debt service payments, mineral lease revenues, and all restricted revenues such as dedicated credits and federal funds are exempt from this limitation.

Significant amendments to the State Appropriations and Tax Limitation Act occurred in the 1996 and 1997 general legislative sessions. First, H.B. 458 exempted \$110 million for the Centennial Highway Trust Fund from the appropriations limit; second, H.B. 401 exempted monies appropriated to fund the costs of construction of capital developments as defined by 63A-5-103(4) from the limit; third, transfers or appropriations made to the Budgetary Reserve Account were exempted; and fourth, contingent appropriations were specifically included under the limit.

The appropriations limitations law restricts the amount of outstanding general obligation debt to 20% of the maximum allowable appropriations limit. S. B. 243 exempted bonding for highway projects from the state's appropriations limitation statute in the 1997 legislative session. Bonding for these projects remains subject to the state's Constitutional debt limit. The statutory appropriations limit in effect for fiscal year 1997 was \$3.1 billion. The Governor's budget recommendations, and the final appropriations enacted by the legislature, have been in strict compliance with this law since its inception in fiscal year 1989.

Tax Collection Tables. Historic tax collections are presented in tables to this chapter in current (not adjusted for inflation) dollars and in constant (inflation-adjusted) dollars. Collections are also adjusted for tax rate and base changes, windfalls and payment accelerations, transfers between revenue categories, and the occurrence of large construction projects in order to ascertain the true underlying trends in revenue collections when compared to general economic activity.

Tables in this chapter also show the distribution of unrestricted revenue funds as a percent of total revenues and total personal income. Table 48 shows that unrestricted general fund and mineral lease monies have generally declined as a percent of total revenues and of personal income, while the uniform school fund percentages have increased. The transportation fund has remained fairly constant due to periodic fuels tax increases such as the 5 cent increase that occurred in fiscal year 1998. These revenue trends largely also reflect stronger historic growth in sales tax-exempt services industries than in taxable goods industries; tax credits and exemptions, income tax bracket creep; increased fuel efficiency of vehicles; and, the transfer of unrestricted general fund and transportation fund monies to restricted accounts. Fiscal year 1998 was the first year in which the Uniform School Fund became larger than the General Fund.

Federal Taxpayer Relief Act of 1997. The recently enacted federal tax reform act of 1997 will impact Utahns in many ways. The key provisions of the act are as follows:

Child Tax Credit. Beginning in calendar year 1998, a \$400 tax credit for each child under age 17 will be available. For some low income families the credit will be partially refundable against payroll taxes (even if they don't owe any income taxes). The credit will phase out at income levels above \$110,000 (\$75,000 for singles). The benefit is reduced \$50 per child for each \$1,000 above the income ceilings. For 1999 and thereafter, the credit will be \$500 per child.

Education Tax Breaks. A nonrefundable "Hope" tax credit will be available beginning January 1, 1998 for 100% of the first \$1,000, and 50% of the second \$1,000, of first and second year post-secondary education tuition expenses (up to a maximum of \$1,500 a year). Beginning July 1, 1998, for the third and fourth years of post-secondary schooling, a nonrefundable credit of 20% of up to \$5,000 of tuition and related expenses is allowed (up to a maximum of \$1,000 a year). Credits are phased out for joint returns with AGI greater than \$80,000 per year (\$50,000 for single returns).

Beginning in 1998, \$1,000 per year of student loan interest is deductible. The student loan interest ceiling increases by \$500 per year to \$2,500 in 2001. As of January 1, 1998, nontax-deductible contributions of up to \$500 per child can be made to Education IRAs, with a phase out of benefits

beginning at \$95,000 for singles and \$150,000 for joint filers. The earnings grow tax free. In addition, penalty-free withdrawals for education expenses are permitted from regular (nonRoth) IRAs.

Home Sales Exclusion. Gains of up to \$500,000 on a joint return (\$250,000 for single filers) from the sale of a principal residence after May 6, 1997 are excluded from income. The home must have been occupied at least two of the five years prior to the sale. The exclusion can be taken every two years. A home of lesser value can be purchased after the sale without penalty, and the seller does not have to be 55 years of age as required under the old law.

Individual Retirement Accounts. The income ceilings for deductible IRAs for taxpayers who are participants in an employer retirement plan (\$50,000 for joint filers and \$30,000 for singles in 1998) will gradually increase (to \$80,000 for joint filers and \$50,000 for singles) by 2007. Nonworking spouses will be able to make full \$2,000 annual contributions even if the working spouse is covered by an employer retirement plan (subject to an income ceiling phase-out beginning at \$150,000).

Beginning in 1998, new Roth IRAs will be available. Contributions are nondeductible, but withdrawals are tax-free if the account has been established for at least five years and the account holder is at least age 59-1/2. The availability of these accounts will begin to phase-out at income levels of \$95,000 for singles and \$150,000 for joint filers. The maximum contribution is \$2,000 per year per person, which will be indexed to inflation beginning in 1998 (in \$50 increments). Penalty-free withdrawals are permitted for first-time home purchase expenses.

Capital Gains Rate Reductions. For sales after May 6, 1997, the top rate on net capital gains drops from 28% to 20%. For sales after July 28, 1997, assets will have to be held for more than 18 months to qualify for the 20% rate. An even lower 18% maximum rate will apply for assets purchased after the year 2000 that are held for at least five years. The 28% maximum rate will remain in effect for assets held for more than 12 months, but for not more than 18 months when they are sold. For taxpayers in the 15% bracket, the top capital gains rate drops to 10%, and to 8% after 2000 for assets held for 5 years. This 8% rate does not require that assets be purchased after 2000.

Estate Tax Relief. The unified tax credit, which now shelters \$600,000 of assets from the transfer tax, will be increased gradually until it shelters \$1 million of assets by 2006. Relief for owners of family farms and small businesses is more generous. Effective in 1998, they get a \$675,000 estate tax exclusion that applies in addition to the \$625,000 sheltered by the unified credit, resulting in a total of \$1.3 million of sheltered assets.

Excise Taxes. Tobacco taxes are to be increased 10 cents a

pack beginning in 2000, and an additional 5 cents in 2002, bringing the federal tax on cigarettes to 39 cents a pack. Uninsured children's health programs were earmarked \$24 billion of the increased tobacco taxes. The airline ticket tax will be reduced from 10% to 7.5% over three years, but each segment of a flight will be subject to a new \$1 fee beginning in October 1997, increasing to \$2.25 in October 1999, and increasing 25 cents per year through 2002. There also will be a \$12 arrival and departure fee for international flights.

Small Business Tax Breaks. Beginning in tax years after 1998, a home office used exclusively on a regular basis as a place of business qualifies for the home office deduction (provided that there is no other fixed location where these activities can be conducted). The health insurance premiums deduction for self-employed taxpayers (currently at 40%) increases to 45% of premiums in 1998, and gradually climbs to 100% by 2007. Small businesses with gross receipts averaging less than \$5 million for the three years prior to 1998 will be exempt from the corporate alternative minimum tax. The current 50% deduction for meals consumed away from home while on business is increased gradually to 80% by 2008.

Benefits to Middle- and Upper-Income Earners

Middle Income Earners in the Near-Term. A recent study by the national Tax Foundation found that in the next five years the vast majority of tax filers will see their taxes lowered. Those earning between \$35,000 and \$100,000 will see the greatest near-term tax relief. The reason being that tax incentives for rearing children and for putting them through college are phased out at upper income levels. Roughly

80% of the average filer's tax cut in the near-term will come from the per child tax credit and the educational tax incentives.

Due to the income-based ceilings on the largest provisions in the tax bill, less affluent states with greater populations of children will see a proportionately greater portion of federal tax relief. While large states can claim the largest total tax relief, they will not see the most tax relief per filer. Over the next five years, Utah is projected to average \$958 (total for 5 years) in tax cuts per filer (the highest in the nation), while Idaho filers will average \$899 in relief (second highest in the nation). The national average is \$764 per filer over the 5 year period.

Upper Income Earners in the Long-Term. The Tax Foundation's long-term (10-year) projection for the impact of the tax law shows that those earning between \$35,000 and \$100,000 could see decreases of more than \$3,000, while filers with incomes of \$200,000 or more could see hefty tax cuts of \$15,000 or more. This is because some tax cuts such as the estate and capital gains tax reforms are phased in over a period of years. A recent study by the Treasury department states that 50% of the tax cuts will flow to the top 20% of income earners over the long-term when all tax cuts are fully implemented. It should be noted that top 1% of income earners paid 30.2% of federal income taxes in 1995 (the latest data available), according to the Tax Foundation. And, the top 25% of income earners paid 80.3% of federal income taxes in 1995. *

Figure 26
Funds as a Percent of Total Revenue

Table 47

Total Budget Tax Increases and Decreases from 1994, 1995, 1996 and 1997 Legislative Sessions*

Bill Number and Effective Year	Bill Subject	Tax and Fee Changes	Cumulative Through FY1999
FY 1995			
H.B. 145 (1994 Session)	Sales Tax Exemption - Replacement Parts for Steel Mills	(\$516,700)	
H.B. 162 (1994 Session)	Sales Tax - Repeal of Flood Tax Authorization	(23,800,000)	
H.B. 205 (1994 Session)	Tax Credit for Low-Income Housing	(226,600)	
H.B. 279 (1994 Session)	Sales Tax - Container Exemption	380,000	
H.B. 302 (1994 Session)	Sales Tax - Vending Machines	310,400	
H.B. 346 (1994 Session)	Sales Tax Exemption - Pollution Control Facilities	1,400,000	
S.B. 090 (1994 Session)	Property Tax Rate & Residence Exemption Changes	(8,500,000)	
S.B. 093 (1994 Session)	Corporate Tax Revisions	50,000	
S.B. 191 (1994 Session)	Treatment of Admission and User Fees	3,290,000	
S.B. 205 (1994 Session)	Sales Tax Exemptions - Transportation Services	600,000	
S.B. 211 (1994 Session)	Sales Tax Exemptions - Coin Operated Devices	1,103,100	
S.B. 238 (1994 Session)	Sales Tax Exemptions - Building Materials	6,920,000	
	Subtotal FY 1995	(\$18,789,800)	(\$93,949,000)
FY 1996			
H.B. 020 (1995 Session)	Tax Incentives to Employ Persons with Disabilities	(\$64,400)	
H.B. 056 (1995 Session)	Sales Tax - Home Medical Equipment	(288,000)	
H.B. 120 (1995 Session)	Sales Tax - Authorized Carrier Exemption	(150,000)	
H.B. 274 (1995 Session)	Sales Tax on Construction Projects	(2,000,000)	
S.B. 043 (1995 Session)	Agricultural Sales Tax Exemptions	275,000	
S.B. 254 (1995 Session)	Gross Receipts Taxes	9,400,000	
S.B. 56 and 254 (1995 Session)	Property Taxes (1)	(141,440,833)	
S.B. 56 and 254 (1995 Session)	Income Taxes (1)	4,500,000	
S.B. 273 (1995 Session)	Sales Tax Exemption on School Fund Raisers	(50,000)	
S.B. 289 (1995 Session)	Sales Tax - Mobile Homes	(1,400,000)	
	Subtotal FY 1996	(\$131,218,233)	(\$524,872,932)
FY 1997			
S.B. 56 and 254 (1995 Session)	Property Taxes (Restricted to New Growth, 1995 Session) (1)	(8,703,800)	
H.B. 274 (1995 Session)	Additional Sales Tax on Construction Projects (1995 Session)	(2,000,000)	
H.B. 58 (1996 Regular Session)	Driving Under the Influence - Repeat Offenders (2)	\$258,000	
H.B. 145 (1996 Regular Session)	Reinstate Sales Tax Exemption on Coin-Operated Laundromats	(263,000)	
H.B. 291 (1996 Regular Session)	Reinstate Sales Tax Exemption on Coin-Operated Car Washes	(345,000)	
H.B. 309 (1996 Regular Session)	Reinstate Sales Tax Exemption on Coin-Operated Amusement Devices	(462,700)	
H.B. 349 (1996 Regular Session)	Gross Receipts Taxes - Modifications (3)	(4,750,000)	
H.B. 404 (1996 Regular Session)	Income Tax - Health Care Insurance Deduction (4)	(4,000,000)	
H.B. 405 (1996 Regular Session)	Minimum School Program Act (Property Taxes)	(30,000,000)	
H.B. 405 (1996 Regular Session)	Income Taxes (1)	1,500,000	
H.B. 1003 (1996 April Session)	College Savings Incentive Program (Tax Deduction, 1996 April Session)	(120,000)	
H.B. 3001 (1996 November Session)	Sales Tax - Manufacturing Exemption Modifications (1996 November Session) (5)	(\$8,700,000)	
S.B. 50 (1996 Regular Session)	Reinstate Sales Tax Exemption on Taxicabs	(117,600)	
S.B. 102 (1996 Regular Session)	Income Tax - Adoption Expenses Deduction	(140,000)	
S.B. 195 (1996 Regular Session)	Income Tax - Credit for Disabled Education Costs	(750,000)	
S.B. 237 (1996 Regular Session)	Income Tax Rate Reductions (6)	(41,000,000)	
S.B. 275 (1996 Regular Session)	Sales Tax - Ski Exemption (7)	(338,000)	
H.B. 27 (1997 Session)	Cigarettes Tax Increase and Regulation (8)	\$462,000	
	Subtotal FY 1997	(\$99,470,100)	(\$298,410,300)
FY 1998			
S.B. 218 (1996 Regular Session)	Reauthorization and Enhancement of Clean-Fuel Incentives (Tax Credits)	(\$10,000)	
S.B. 239 (1996 Regular Session)	Tax Credits for Rural Economic Resettlement Zones (Tax Credits)	(275,000)	
H.B. 249 (1996 Regular Session)	Recycling Market Development Zones (Tax Credits)	(20,000)	
H.B. 1003 (1996 April Session)	Additional College Savings Incentive Program (Tax Deduction, 1996 April Session)	(120,000)	
H.B. 3001 (1996 November Session)	Additional Sales Tax - Manufacturing Exemption Modifications (1996 November Session) (5)	(8,700,000)	
S.B. 29 (1997 Session)	Sales Tax Exemption for Scrap Recyclers	(76,900)	
S.B. 50 (1997 Session)	Sales Tax Refund On Donated Food	(86,500)	
S.B. 161 (1997 Session)	Motor Vehicle Compliance With Insurance, Registration, And Sales Tax Requirements	\$870,000	
S.B. 252 (1997 Session)	Collection of Fuel Tax (9)	10,000,000	
S.B. 253 (1997 Session)	Fuels Taxes, and Repeal of Environmental Surcharge on Petroleum (10)	63,250,000	
S.B. 253 (1997 Session)	Sales Tax Reduction (10)	(34,300,000)	
H.B. 27 (1997 Session)	Cigarettes Tax Increase and Regulation (8)	21,800,000	
H.B. 84 (1997 Session)	Sales Tax Exemption for Employee Transportation	(9,500)	
H.B. 111 (1997 Session)	Transportation Corridor Funding (11)	4,300,000	
H.B. 124 (1997 Session)	Licensing of Day Care Facilities	15,000	
H.B. 225 (1997 Session)	Assessment on Workers' Compensation (12)	6,100,000

Table 47 (Continued)**Total Budget Tax Increases and Decreases from 1994, 1995, 1996 and 1997 Legislative Sessions*****Footnotes:**

(A) This table shows the fiscal notes for state tax and fee increases or decreases only. Changes in local taxes are not included. Extensions of existing exemptions are also not included. S.B. 36 (1997 Session) extends the tax credit for energy savings systems (at a cost of \$27,000), S.B. 41 (1997 Session) extends the coal tax credit exemption (at a cost of \$250,000); and, S.B. 139 (1997 Session) extends the tax credit for wood or pellet burning stoves (at a cost of \$35,000). The April 1996 Special Session of the Legislature passed SB1004 (Sales and Use Tax Exemption - Steel Mill Contracts and Orders) to partially extend the sales tax exemption for steel mills. The original exemption (H.B. 145, 1994 Session) expires in FY1997.

(B) This table does NOT include shifts within the total state budget due to earmarking or other diversions. For example, H.B. 393 (1996 Session) reduces General Fund sales tax revenues by \$36 million beginning in FY1998 in order to earmark sales taxes to water and local transportation projects; but, total budget sales taxes were not reduced by this bill. H.B. 413 (Sales Tax Revenues to Transportation Funding, 1997 Session) diverts \$4,200,000 in FY 2001 in sales tax revenues currently earmarked for the Olympics to roads. Finally, H.B. 94 (1997 Session) shifts \$210,000 from unrestricted criminal surcharge funds to a restricted Guardian Ad Litem account.

(1) In 1995 the Legislature and Tax Commission increased the residential exemption from 32% to 45%, decreased the basic school rate from .00422 to .00264, and reduced the state assessing and collecting rate from .0003 to .000281. The 1995 Legislature also restricted the growth in taxable valuations to new growth only, effective in fiscal year 1997. In 1996 the Legislature further ordered the Tax Commission to reduce the basic school rate to a level sufficient to generate a \$30 million tax cut. Income tax collections will increase due to lower property tax deductions on income tax forms.

(2) Increased fines and surcharges.

(3) Effective January 1, 1996, reduced gross receipts tax rates 53 percent to benefit electric utilities.

(4) Effective January 1, 1996, allows 60 percent of health care insurance, not already deductible against federal taxes, to be deducted against state taxes owed.

(5) As of July 1996 (FY97) 30% of the exemption is allowed, as of July 1997 60% is allowed, and as of July 1998 100% is allowed. The original fiscal note for FY99 was \$28.6 million. The Tax Commission subsequently ruled that parts (in addition to equipment) were eligible for the exemption which raised the fiscal note for FY99 to \$71.3 million. In November 1996 a special session of the legislature meet to modify the law in order to restore the fiscal note to \$28.6 million in FY99.

(6) Reduced effective income tax rates as of January 1, 1996. Reduced top rate from 7.2 percent to 7.0 percent on taxable incomes over \$7,500. The minimum income tax rate will be reduced from 2.55% to 2.3%.

(7) This is a consensus estimate. The Fiscal Analyst's estimate is \$65,000.

(8) Increases the cigarette tax 25 cents per pack. FY1997 fiscal impact is from stocking up of inventories in order to partially avoid the July 1, 1997 tax increase.

(9) Changes the point of collection for the diesel fuels tax from dealers to refineries.

(10) Raises the diesel and gasoline tax 5 cents a gallon and reduces the sales tax by 1/8th cent. Enactment of this bill will generate \$63,250,000 in increased revenue to the Transportation Fund due to the increase in the diesel and gas tax and the 1/2 cent diversion from underground storage tanks to highways. There will be a decrease in General Fund sales taxes of \$34,300,000. The net tax change from this bill is \$28,950,000.

(11) Implements a 2.5 percent tax on rental cars to pay for transportation corridors.

(12) Permits the Department of Workforce Services to impose an assessment related to the Employers' Reinsurance Fund.

(13) Creates an Endangered Species Mitigation Fund and imposes a royalty tax on brine shrimp harvesting.

(14) Increases the vehicle registration fee by \$10 and trucking fees by about 10 percent. This restricted money goes into the Centennial Highway Trust Fund.

International Merchandise Exports

Overview

The value of Utah's 1997 international merchandise exports is estimated to be \$3.49 billion, a slight decrease from 1996. Utah's largest merchandise export industries are primary metals, industrial machinery, transportation equipment, electronic machinery, and metallic ores. Utah's largest markets for merchandise exports are in eastern Asia, Canada, and Europe. Current market uncertainties in Asia have the potential to negatively impact Utah's export ties; however, these economies rely heavily on the products they import from Utah.

1997 Summary

Value of Utah's Exports. Merchandise exports from Utah companies to international markets reached an estimated \$3.49 billion in 1997, a slight decrease from the previous year's total of \$3.62. Because final data on the components and destination of 1997 exports are not yet available analysts can only speculate about the reasons for this decline. The Asian economic crisis and prices for copper (Utah's biggest export), almost certainly accounted for part of the decline.

Detailed data is available for 1996. Exports in 1996 reached the second highest level recorded since data began being compiled in 1988. Utah ranks 31st in the nation in total value of merchandise exports, and 18th in terms of growth in exports between 1995 and 1996.

The state of Utah has become more integrated into the world economy as the value of merchandise exports has grown from \$943 million in 1988 to \$3.62 billion in 1996, an increase of \$2.7 billion or 284%. Over this same period, gross state product (GSP), the broadest measure of the productive activity in the state, has grown from \$27.0 billion to an estimated \$43.9 billion, an increase of \$16.9 billion or 62.6%. Thus merchandise exports have gained in share of GSP from 3.5% in 1988 to 8.2% in 1996.

Composition of Utah's Exports. In 1996, primary metal products were 29.9 % of the value of Utah's international merchandise exports. Other major export industries in 1996 were industrial machinery (11.9%), transportation equipment (10.4%), electronic machinery (9.9%), and metallic ores (6.0%). This composition is shown in Table 53.

From 1995 to 1996, the largest increases in the value of exports were found in the following industries:

- ✻ Agricultural products
- ✻ Fishing, hunting and trapping
- ✻ Lumber and wood products

The largest decreases in the value of exports were found in:

- ✻ Livestock products
- ✻ Scrap and waste
- ✻ Metallic Ores

Utah ranks second nationally in copper production. Copper prices increased from \$1.07 per pound in 1994 to \$1.35 per pound in 1995, helping to bolster the value of metallic exports. But in 1996, the price of copper dropped to approximately \$0.98 per pound. Since metallic ores and primary metals comprise a large portion of Utah's total exports, lower copper prices help explain why there was a slight decrease in total exports in 1996.

Destination of Utah's Exports. Utah's largest markets for merchandise exports are in eastern Asia, Canada, and Europe. In 1996 the top five destination countries for Utah's merchandise exports accounted for \$2.27 billion of the \$3.62 billion total, or 62.7% of total exports. Further, these top five destination markets purchased 81.5% of primary metal exports, 77.3% of transportation equipment exports, 75.5% of coal exports, 61.9% of chemicals and allied products, 52.4% of instruments and related product exports, 48.0% of electrical and electronic machinery exports, 44.4% of metallic ore exports, and 40.1% of industrial machinery exports from Utah in 1996.

From 1988 to 1996, Utah export markets with the highest average annual growth are predominately Latin American and Asian countries. The United Kingdom also ranks as one of the top ten countries with the highest annual average growth from 1988 to 1996.

The United Kingdom, Utah's second largest export market in 1995, was the state's largest export market in 1996. The great bulk of the \$660.5 million in purchases (81.1% or \$535.4 million) consisted of primary metals.

Japan was the second largest market for Utah exports in 1996, purchasing a total of \$586.1 million of merchandise. Exports to the Japan were disbursed across industries with significant purchases of coal (23.2% or \$136.3 million), transportation equipment (20.1% or \$117.9 million), metallic ores and concentrates (15.3% or \$89.9 million), instruments and related products (9.9% or \$57.9 million), and chemicals and allied products (7.2% or \$42.2 million). Asian economies are currently struggling with slower economic growth, banking problems, currency devaluations and higher interest rates. If the recent turmoil in this region continues, it could have a negative impact on Utah's export ties to countries like Japan, Taiwan and Singapore. However, in spite of a decrease in the purchasing power of these countries, their economies rely heavily on many Utah export products.

Canada was Utah's third largest merchandise export destination in 1996 and also had purchases distributed across a range of industries. Of the \$432.8 million total of Utah merchandise exports to Canada in 1996, \$89.3 million (20.6%) was transportation equipment, \$69.0 million (15.9%) was industrial machinery, and \$58.9 million (13.6%), primary metal products.

The Republic of Korea, Utah's eighth largest export market for 1995, was the fourth largest export market in 1996. About 65% (\$235.8 million) of this was primary metal products, 11.1% (\$39.8 million) was chemicals and allied products, and 8.9% (\$31.9 million) was electrical and electronic machinery.

Germany, Utah's seventh largest export market for 1995, was Utah's fifth largest export market in 1996. Of the \$233.3 million total of Utah merchandise exports to Germany in 1996, \$68.2 million (29.2%) was transportation equipment.

Significant Issues

Asian Economic Crisis. The Asian economic crisis could have major implications for Utah's export sector. Asia is Utah's number one export customer and copper is Utah's number one export. Analysts will monitor Asia's economic problems carefully over the coming months to ascertain the seriousness of the situation to Utah's export industry.

Limitations of Data. The export data presented have been generated by the U.S. Census Bureau, Foreign Trade Division and have been adjusted by the Massachusetts Institute for Social and Economic Research (MISER). There are two main reasons why this data series, called "Origin of Movement," may substantially underestimate the magnitude of Utah exports. First, the data series is designed to measure the transportation origin of exports, and accounts for the value of merchandise exports but not service exports. This means that exports of business services (such as financial services or computer software), educational services (such as international students paying tuition to purchase Utah education), tourist services (such as purchases made by international travelers in Utah), and other services sold in international markets are not included in the value of these exports.

Second, the "Origin of Movement" series tracks the merchandise from where it begins its export journey. The Shipper's Export Declaration (SED) accompanies each commodity shipment of \$1,501 or more before 1990, and \$2,501 or more since, that leaves the United States and provides the basis for the export information. In other words, the exporter is not necessarily the producer or the manufacturer of the merchandise shipped. For these two reasons, one must exercise caution when comparing this data with other data published by the U.S. Department of Commerce. *

Prices, Inflation, Cost of Living

Overview

Inflation grew at a decelerated pace, registering 2.4% in 1997 compared with a 3.0% growth rate in 1996. The gross domestic product chain-type price deflator increased 2.0% in 1997. Utah's cost-of-living index in selected cities remained near the national average. The second quarter 1997 composite index (national average equals 100) for Salt Lake City was 105.1; Provo-Orem, 102.0; Cedar City, 92.4; St. George, 101.1; and Logan, 103.0.

1997 Summary

Consumer Price Index. Despite an accelerated national economic growth rate, a fully employed economy, and modestly rising wages, the national rate of inflation actually slowed in 1997. The Consumer Price Index (CPI) is estimated to have increased 2.4% in 1997, measured on an annual average basis, compared with 3.0% in 1996. By October 1997, the year-to-year CPI gain had slowed to 2.1%.

Economic factors contributing to this decelerated pace of price increases include: (1) intense international and domestic competition that minimized sellers' ability to raise prices, (2) a rising U.S.-dollar exchange rate that lowered the price of imported goods, and (3) rising labor productivity that offset much of the gain in wages.

Gross Domestic Product Deflators. In 1997 the Gross Domestic Product (GDP) chain-type implicit price deflator is estimated to increase 2.0% compared with 2.3% in 1996. The GDP personal consumption deflator in 1997 rose approximately 2.1% compared to 2.4% in 1996. Beginning in 1996, the Real Gross Domestic Product was reported using a chain-weighted inflation index. Under this method, the composition of economic output (the weights) is updated each year (Table 57).

Utah Cost of Living. The American Chamber of Commerce Researchers Association (ACCRA) Cost of Living Index is prepared quarterly and includes comparative data for approximately 270 urban areas (Figure 31). The index consists of price comparisons for a single point in time, but does not measure inflation or price changes over time. The cost of consumer goods and services in the urban areas is measured and compared with a national average of 100.

The composite index is based on six components: grocery items, housing, utilities, transportation, health care, and miscellaneous goods and services. The Salt Lake Area Chamber of Commerce is a member of ACCRA and submits quarterly data for the local area. Additional Utah-specific

price information can be obtained through First Security Bank or Weber State University.

The second-quarter 1997 composite index for Salt Lake City was 105.1, slightly higher than the national average for the quarter. Other Utah cities included in the second-quarter survey were Cedar City (92.4), Logan (103.0), Provo-Orem (102.0), and St. George (101.1), as found in Table 58.

1998 Outlook

The national Consumer Price Index for Urban Consumers (CPI-U) in 1998 is forecast to increase 2% to 2.25%—slightly lower than in 1997. Imported goods from Asia will be considerably less expensive, and prices of computer-related products should also continue their lower-cost trend. Medical costs in 1998, however, may rise faster than has occurred during the past two years, and moderately higher wage rates are also a distinct possibility in 1998.

Significant Issues

No Statewide Measure of Inflation. Measuring and understanding price changes over time and cost of living for a point in time are critical to understanding economic issues. In Utah there is no statistically significant, statewide measure of inflation (price change over time). The federal Bureau of Labor Statistics does sample price changes in Utah as part of the national indices of inflation, but the sample size is too small to render meaningful results at the state level. Consequently, monetary measures in Utah are generally adjusted for inflation using national indices such as the Consumer Price Index (CPI) and Gross Domestic Product Deflators.

1998 CPI Revision. Beginning with the January 1998 data, the Bureau of Labor Statistics will initiate several improvements to the CPI Index. A new set of expenditure weights, using 1993–1995 Consumers Expenditure Survey data, will replace the 1982–1984 weights now used. The CPI will also utilize a new geographic sample, a new item structure, and a new variance-based publication system.

Experimental CPI. In 1997 the Bureau of Labor Statistics introduced an experimental CPI using geometric means: the CPI-U-XG. This experimental methodology attempts to measure the impact of consumers' decisions to change spending patterns as relative prices change. If the assumptions employed are accurate, the index using geometric means will provide a closer approximation to a cost-of-living index. In recent months the experimental CPI has shown a rate of price increase only slightly below the CPI-U. *

Social Indicators

Overview

Quality of life is a subjective notion based on perceptions and interpretations that can be contradictory. In Utah, 1997 was a year of continued economic prosperity. And again the state received positive review in studies when compared to others. Utah was named among the top five healthiest states and "most livable" states and as being among the best states in which to raise children. However, sustained economic and population growth can have adverse effects on the quality of life in Utah communities. Utahns have identified growth and crime as being among the most important issues facing Utah today in a recent survey.

1997 Review

State-to-State Comparisons. Several organizations choose a variety of indicators to compare conditions from state-to-state. The strength of these studies is that the final rankings are based on a composite of indicators. Utah has been named among the best in several studies, including:

- ✦ Morgan Quitno Press found Utah to be the fifth healthiest state based on factors such as: adult smoking percentages, infant mortality, childhood immunization rates, health insurance coverage, per capita spending on health care, and others.
- ✦ The same organization ranked Utah as the fourth most livable state. This study used 42 factors including crime rates, personal income, state and local taxes, public library offerings per capita, days with sunshine, educational attainment, infant mortality, homeownership, and others.
- ✦ Utah ranks seventh in caring for its children according to the Annie E. Casey Foundation. The Foundation uses 10 indicators: low birth weight babies, infant mortality, child death rate, teen violent death rates, teen birth rates, juvenile violent crime arrest rates, high school dropouts, idle teens, poverty, and single-parent headed families.

Utah Quality of Life Information.

State of ALERT. Maintaining Utah's quality of life as we enter the 21st century, will depend heavily on the ability to build human capital—preserving the welfare of children is a crucial first step in this process. Governor Leavitt issued a State of ALERT to the people of Utah that culminated in a volunteer summit in October, 1997. The State of ALERT for Utah's children calls on citizens to assure and preserve public safety, build opportunities for our youth, support existing community efforts, engage in service to others, and safeguard the values that are now enjoyed. The initiative has identified goals to be accomplished by the year 2000, each with a data component, specifically:

- ✦ A caring adult in the life of Utah children. Utah will have 3,000 trained foster care families and an increased

number of volunteers in new and existing mentoring programs for at-risk children.

- ✦ Make Utah a safer place to live. Every community will be part of a community crime prevention council.
- ✦ Give Utah children a healthier start The number of low birth weight babies born in Utah will decrease 10%.
- ✦ Give Utah youth more marketable skills. Approximately, 12,000 youth who are at risk of becoming functionally illiterate will be reading at the third-grade level.
- ✦ Provide opportunities for service. About 75% of youth, ages 12 to 18, will volunteer a significant amount of time in service to others each month.

Utah Kids Count Project. Information about child well-being is a critical part of understanding standard of living. A collection of indicators is reported on in *Measures of Child Well-Being in Utah: 1998*¹. The Utah Kids Count Project tracks data on children for each of the counties in the state and produces the report annually. The data fall into the domains of health, education, safety and economic security—with 20 measures.

Consumer Survey. The *Utah Consumer Survey* is conducted by Valley Research, Inc. and provides valuable information about consumer sentiment in addition to: policy issues; income and employment; purchase intentions and spending; motor vehicles; home buying and building; health care/health insurance; and demographic characteristics. The survey has been administered for several years and allows comparisons over time. The most recent survey was during October 1997. Interviews were conducted by telephone with 515 randomly selected adults throughout Utah. The survey report details the answers given by respondents. One of the questions asked is "what is the most important issue facing Utah today?" Crime and legal issues and growth issues have consistently been identified as being most important.

Utah Tomorrow. Utah's future success also requires the continued development of sound public policies. Utah Tomorrow is a planning effort "designed to enable all segments of Utah society to focus on and measure progress toward specific goals for Utah's future and to move away from reactive methods of public policy-making toward more visionary proactive approaches."² The goals are clustered around the following topics: culture; economic development; education; environment, natural resources and agriculture; free enterprise and regulatory systems; government; health

¹ Utah Children, *Measures of Child Well-Being in Utah: 1998*. Salt Lake City, Utah. 1998.

² Utah Tomorrow Strategic Planning Committee, Office of Legislative Research and General Counsel. *Utah Tomorrow Strategic Plan, 1996 Annual Report*. Salt Lake City, Utah

and safety; human services; infrastructure; and justice.

The *Utah Tomorrow Strategic Plan*, updated annually, reports on the goals in each topic, as well as related objectives. The report lists over 700 performance measures and provides data detailing the progress on those measures.

Social Indicators

The data items shown as social indicators in this chapter have not been interpreted or analyzed. They are presented here to stimulate thought on the interaction of economic performance and social well-being. No effort has been made to give weights to the measure, or to develop a composite index that would allow the data to be compared over time or by geographic area.

Current Population Survey Data. It should also be noted that the source of the data on educational attainment, poverty, public aid, health insurance coverage, and home ownership is the U.S. Bureau of the Census and U.S. Bureau of Labor Statistics. These agencies provide state rankings from the *Current Population Survey*. The *Current Population Survey* is a monthly survey of approximately 50,000 households nationwide. The sampling variability in state estimates from the survey is problematic because of the small sample size. Precise estimates about rank (and changes in ranks over time) are not possible, but the data provide a general indication of the relative level of indicators from state to state. This caution does not apply to the crime statistics, or vital statistics which are obtained from government records.

Crime. Statistics for 1995 from the FBI's uniform crime reports show the rate of violent crimes per 100,000 persons to be 328.8 in Utah, less than half the U.S. rate of 684.6. Eleven states had lower rates than Utah (Table 60).

Utah also compared favorably to other states for statistics on the number of federal and state prisoners per 10,000 population in 1995, ranking 45th from the highest, with a rate of 17.7. The number for the U.S. as a whole was 42.9 (Table 60).

Education. Table 60 provides 1990 educational attainment percentages from the Decennial Census. Utah had the second highest percentage of persons age 25 and over with at least a high school degree (85.1%). Utah is

ranked 15th for the percentage with a bachelor's degree or higher (22.3%).

Vital Statistics and Health. Utah's age composition affects its ranking among other states on many vital statistics. As discussed in the Demographics chapter of this report, Utah has the highest percentage of the population under 18 years of age (33.9% in 1996) of any state and lowest median age (26.8 in 1996). Utah also has among the lowest percentage of the population over age 64 (8.8% in 1996). The statistics in this domain, excluding health insurance coverage, are from the National Center for Health Statistics

Births. The birth rate in 1996 was estimated the highest of all states at 20.7 births per 1,000 people. Arizona had the second highest rate at 18. The U.S. rate is 14.8.

Deaths. The infant mortality rate (deaths to infants less than 1 year-old per 1,000 live births) was 6.2 in Utah in 1994 and five states had lower rates.

Utah's age composition means that most Utah residents are not yet old enough to get cancer or heart disease; consequently, Utah ranks among the best (49th highest) for death from these causes. The death rate per 100,000 people in 1992 from heart disease was 151.8 and from cancer, 108.3.

Health Insurance Coverage. In 1996, approximately 12% of the population was without health insurance coverage. The U.S. average is 15.6%.

Poverty. Utah is among the states with the lowest poverty rates. Statistics from the *Current Population Survey* show 8% of the population in poverty in Utah in 1996. Only one state had a lower poverty rate (New Hampshire, 6.5%). In the U.S. it is estimated that 14% of the population was in poverty in 1996.

Public Assistance. Only 3.6% of the population were recipients of public aid in Utah in 1994, according to *Current Population Survey* data. With that figure Utah ranks 48th from the highest. The U.S. average was 7.7%.

Home Ownership. Home ownership rates show that Utah has the tenth highest percent of home owners at 72.7%. The rate for the nation is 65.4%. The lowest rates were in D.C., Hawaii, New York and California. ✱

Regional / National Comparisons

Overview

The 1990s have been a period of sustained economic growth for the Mountain Division¹. The mountain region is in the midst of a six year economic boom and leads the nation in economic vitality and growth. Among the eight mountain states in 1996, Utah ranked third in population growth, second in personal income growth, fourth in average annual pay as a percent of the U.S. average, and second in employment growth.

1996 Summary

Population Growth. Population growth in the mountain states continues at a relatively rapid rate, about 2.5 times as fast as experienced nationally. In 1996, the population growth rate was 2.3%. The favorable economic conditions in the mountain west will support continued above-average population growth. From 1995 to 1996, the population in Mountain Division states increased by 368,000, to a total of 16,118,000 inhabitants, for a growth of 2.3% compared to a 0.9% increase nationally (Figure 32 and Table 62). From 1991 to 1996 the five fastest growing states (in terms of percent increase), were Nevada, Arizona, Idaho, Colorado, and Utah, (New Mexico ranked 7th). In 1996, the mountain states continued to attract in-migrants to the area. Net in-migration has been quite strong since 1990 and continues, as a result of the sustained, above average, economic performance of the mountain region.

Personal Income Growth. Total personal income for the region grew at an average annual rate of 7.7% from 1991 to 1996, as compared to the national rate of 5.5%. Utah's average annual growth of personal income was 8.3% during this period (the second fastest rate in the nation behind Nevada). All states in the mountain region except Wyoming have had personal income growth rates above the national average since 1991 (Table 63).

From 1995 to 1996, income grew by 7.2% in the mountain states compared to 5.6% in the U.S. The most recent data show that income growth is quite strong in this region relative to the nation. Personal income grew by 6.8% and 5.7% in the mountain states and the U.S., respectively from the second quarter of 1996 to the second quarter of 1997. During this same time, personal income grew 8.9% in Nevada, 7.9% in Utah, and 7.8% in Arizona; the first, second and third largest percent increases of all 50 states.

Six of eight mountain states experienced an increase in per capita personal income relative to the U.S. average from 1991 to 1996. Per capita personal income for a region can

¹As defined by the Bureau of the Census, the Mountain Division includes: Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah and Wyoming.

change relative to the U.S. average because the region's total personal income, its population, or both, grow at a faster or slower rate than the U.S. average. From 1991 to 1996, income in the mountain region grew 40% faster than the national rate, while population grew 175% faster. The result is that per capita income for the mountain states has increased relative to national per capita income (Table 64). In 1991, per capita income in the mountain region was \$17,540, or 89.1% of the national figure of \$19,689. By 1996, per capita income for the mountain states was 90.6% of the national figure--\$22,139 compared to \$24,426.

Per capita total personal income is one statistic that is used to measure relative economic prosperity between states. In Utah, on average, the birth rate is higher and household size is larger than found in other states. With 34% of Utah's population under the age of 18, compared to 26% nationally, Utah's per capita income is just 80.2% of the national figure of \$24,426 for 1996. This rate of 80.2% is the 3rd lowest of any state in the region (Figure 33).

Another measure of relative economic prosperity, total personal income per household, recognizes that most people live in households and not as individuals. In 1996, Utah's per household income (\$61,305) was third out of the eight mountain states, and was 93.4% of the national figure of \$65,619 (Figure 34 and Table 65). Total personal income per household in the mountain region at \$59,258 was 90.3% of the U.S. average.

Wages. The most complete measure of relative wages paid between states is average annual pay for all workers covered either by state or federal unemployment insurance programs. Wage growth for the intermountain region was 3.4% per year and 3.3% in the U.S. from 1991 to 1996, (Table 66). Wages increased slightly from 89.5% of the U.S. average in 1991 to 90.0% by 1996. As a percent of the national average, wages remained the same in Utah, 84.9% of the U.S. average over this five-year period. In 1996, average pay in Utah of \$24,572 was fourth among the eight mountain states, and 34th nationally (Figure 35). The most recent data show wages increasing among mountain states relative to wages nationally--from 89.8% of the U.S. average in 1995 to 90.0% in 1996. This is the third consecutive year to show that the strong regional economy is putting some upward pressure on wages. Relative wage increases occurred in 1994, 1995, 1996 and are likely for 1997 and 1998.

Labor Market Activity. From 1991 to 1996, the mountain region's employment growth rate was a little more than twice that of the nation. Nonagricultural job growth in the region averaged 4.5% per year, while the national rate was 2.0%. Among the eight states of the region, job growth per year

was the highest in Nevada (6.0%), Utah (5.1%), Arizona (4.9%), Idaho (4.3%) and Colorado (4.2%). These rates were the fastest job growth rates for all 50 states over this five-year period. During this period, every mountain state except Wyoming increased in employment at a faster rate than the national growth rate (Table 67).

The most recent complete year for which data is available is 1996. From 1995 to 1996, nonagricultural employment growth in the mountain region was 4.3%, compared to the national rate of 2.0%. Of the 50 states, Nevada, Arizona, and Utah led the way with job increases of 7.2%, 5.6% and 5.2%.

The latest available information for all states, October 1996 to October 1997, indicates that the job picture in the mountain region, while slowing from last year's rapid pace, is expanding at a healthy rate of 3.2%. Three states, Nevada, Arizona, and Utah, are out-pacing all other states with net new job creation of between 5.4% to 4.1% (Figure 36). Nonagricultural job growth averaged 2.4% for the nation.

The latest data indicate that unemployment in this region is about 3.8% compared to 4.4% for the U.S. (October 1996 - not seasonally adjusted, Table 68. This relatively favorable unemployment situation for the mountain states is indicative of the economic strength this region has maintained during the 1990s.

Significant Issues

Broad-Based Strength. Economic growth in the mountain region is moderating from the rapid growth experienced since 1990. The states of the intermountain west have been recognized nationally as having a favorable business climate: including moderate business taxes, less government regulation, a relatively youthful and educated populace, lower wages, and affordable housing. In addition, the quality of life in the mountain states with lower crime, well-functioning schools, and abundant recreational

opportunities has been praised. For the past few years there has been a noticeable migration of jobs and people into this region.

California's Economic Success. The California economy has rebounded from the doldrums experienced earlier in the 1990s. Currently, the California economy out paces the U.S. with 2.6% job growth (October 1996 to October 1997) compared to 2.4%. With a revitalized economy, there has been a reduction in the flow of people and jobs from the west coast into the mountain states. Even with the reduced migration of people and jobs from California, the favorable business climate, youthful and energetic labor force, economic strength and diversity, and the quality of life will continue to attract some migrants into the mountain states from around the country.

Housing Prices and Labor. Sustained strong growth has resulted in increased housing prices and made for a tight labor market. The slower growth that has been witnessed in recent months is welcome to prevent serious economic imbalances from developing. Regional job growth in the 3% to 3.5% range is still very healthy, yet more sustainable.

Conclusion

The national economy is expanding at a moderate pace as 1998 begins. Mountain Division state economies are experiencing the sixth straight year of an unprecedented, broad-based expansion. While the mountain states have been able, to this point, to expand economically without developing serious labor shortages or other bottlenecks, the rapid growth since 1990 has put inevitable strains on infrastructures and resources. Increasing housing prices, low rates of unemployment, labor shortages (particularly among skilled workers) and upward pressure on wages are the results. Regardless, the states in the Mountain Division will continue to outperform the nation as a whole during 1998. *

Industry

Focus

Overview

Agricultural production in Utah during 1997 was affected primarily by above average precipitation in many parts of the state, and price fluctuations as a result of the 1996 farm bill. Passage of the farm bill eliminated many government price-support programs, and many farmers, especially in the dairy sector, experienced lower revenues and increased production costs—resulting in a dramatic decline in profits between 1996 and 1997. The production outlook for 1998 is healthy.

It is unlikely that any industry in Utah is as affected as much by uncertainty as is agriculture. Weather, price risk and changes in the general economy all have a major impact on farm production and profitability. Passage of the 1996 Farm Bill added a new dimension—the elimination of most government programs that were designed to provide some stability in prices (support prices were commonly used for many commodities). As a result, farmers and ranchers throughout the nation have experienced changes in prices and production that have not occurred in the past.

Many of these factors have affected agricultural producers in Utah. Numerous examples could be cited but the changes during the past year that have affected dairy farmers illustrate the problems many farmers and ranchers face. Milk prices were as high had existed for many years in the fall of 1996 but within a year the price of milk received by dairymen declined more than 20% (from \$15.20 per hundred in October 1996 to \$12.50 in October 1997). This occurred at the same time that hay prices (feed costs are more than 50% of the cost of producing milk for most operators) increased from \$67 a ton in October 1996 to \$87 in October 1997—an increase of more than 20%. As a result, revenues have declined while costs have increased. Profits dropped dramatically in 1997 when compared to 1996. Changes such as these have recently become more common in most agricultural sectors and will affect agriculture and its role in the state's economy in the future.

1997 Summary

1997 will be remembered by many producers as one that was unique in many ways. The drought that plagued southern Utah in 1996 was followed by above average precipitation in 1997 in most areas of the state. This was very beneficial to some sectors while it had a negative impact on others. Many beef operators using rangelands experienced a phenomenal year of production. The amount of forage that could be grazed was much greater in most areas of the state than had existed in most years. Rainfall not only was higher than usual but the period(s) when it arrived was often at "just the right time." Grazing operations were not the only ones that were positively affected by the

high levels of rainfall that were received. Winter wheat production in Utah has been estimated to be 18% above the levels that existed in 1996. This large increase occurred at the same time that winter wheat production only increased about 8% nationally. The above average rainfall had a number of positive impacts including the filling of reservoirs that can be used for irrigation in 1998.

Unfortunately the above average rainfall also had a some negative impacts. The quality of hay produced was reduced in most areas because much of it was rained on after being cut—very few farmers were able to harvest all crops of hay without at least some of it being rained on and many farmers were not able to harvest any hay that had not been rained on after it had been cut. As a result, the quantity of high quality hay is very limited while a relatively large supply of lower quality hay exists in most areas of the state—this tends to help beef operators and hurt dairy producers.

Agricultural Receipts. Utah agricultural receipts have been and continue to be dominated by the production of livestock and livestock products (see figure). The distribution of these receipts, however, has not been stable over time. For example, the production of cattle and calves has generally been about one-third of all agricultural receipts for many years but, the percentage has varied over time (Table 70). A large percentage of the crops grown and sold are for use by the animal sectors (e.g., hay, feed grains). The data in Table 70 also suggest that some sectors have grown relative to others. Sheep production has declined for many years, while hog production has been rapidly increasing the last few years. Sheep production declined about 7% nationally between 1996 and 1997, while the decline was less in Utah—the state remains one of the leaders in the production of sheep and lambs. However, sheep production is becoming less important as a source of receipts nationally, regionally and in the state. This decline is contrasted with the large increases in hog production that have been occurring in Utah the last five years. The number of hogs in Utah more than doubled between 1996 and 1997. The Circle Four complex in southwestern Utah is rapidly becoming one of the leading areas in the production of hogs nationally.

Dairy Products. The production of dairy products has been and continues to be an important part of Utah agriculture. Decisions will be made in 1998 that will affect this industry in the coming years. The large fluctuations in prices are a fairly recent phenomenon that has affected many dairy farmers. These price fluctuations are expected to continue, and may be accentuated in the coming year. The 1996 Farm Bill required a reduction in the number of milk marketing orders. Utah is currently in one milk market order that has a relatively high percentage of class I (primarily fluid milk consumption) use when compared to the milk marketing

order for southern Idaho. If these two milk marketing orders are combined (a most likely scenario), then the price received by Utah dairy farmers will likely decrease. This coupled with the decision by Dannon to delay the opening of their plant in southwest Salt Lake County for the making of yogurt (current plans are to open the plant for the production of bottled water) will probably result in lower local milk prices than predicted a year ago.

The Turkey Industry. There is probably no animal related sector in Utah agriculture that is struggling to a greater degree than is the turkey industry. Prices received by turkey producers have been close to or less than the cost of production for most producers in the past two years. As a result, some have chosen to cease production. If this trend continues, there may not be enough turkeys produced to make the operation of the processing plant feasible. Should this occur, one of the major industries in Sanpete County will be lost. This will not have a major impact on the state's economy, but it will likely have a major impact on the economy of Sanpete County.

The Mink Industry. One industry in Utah that has recently received considerable press is the mink industry because of animal rights groups. Utah ranks second (Wisconsin is first) in the production of mink pelts. But, when production of mink in southern Idaho (primarily Franklin county) is combined with Utah (most mink producers are in northern Utah) this region is the largest production area in the nation. Furthermore, production in this region has increased the last few years while production nationally has declined.

Cattle and Calves. The leading sector in Utah agriculture is the production of cattle and calves. Unlike most other agricultural sectors, it exists in all areas of the state. Its relative importance however, is not evenly distributed. For example, cattle production is especially important in counties such as Rich, Daggett, and most counties in southern Utah. Cattle producers are just recovering from a period of relatively low prices in 1995-96. Prices are expected to increase again in 1998 which will also result in

increased demand for feed and forage. This should result in increased agricultural income in most areas of the state.

The Greenhouse and Nursery Sector. One sector that continues to make slow but steady progress is the greenhouse and nursery sector. While the number of growers is not large (there were 93 firms in 1997 with sales of \$10,000 or more), they are an integral part of Utah—nearly 55% of total sales are for bedding and garden plants that are grown primarily for use by Utah's urban residents. This growth differs significantly from the production of fruits and nuts which has generally declined over time relative to other sectors. These firms are generally located near the major cities and represent a relatively small portion of the economic activity in these areas. This is very different from agriculture in rural Utah, which is generally dominated by livestock enterprises and where agriculture has a much larger impact on the local economy.

Significant Issues and 1998 Outlook

Adjustments in various sectors within agriculture will not be equally distributed within the state. For example, turkeys are primarily located in Sanpete County; dairy in northern Utah and Millard County; sheep in Sanpete, Utah and Box Elder Counties; fruit in Box Elder and Utah Counties; and hog production in Beaver county. Agricultural income is expected to increase in 1998, but some sectors and areas will experience declines as a result of the adjustments noted above. Overall agricultural production should be healthy in 1998 with prospects for high growth in hog production and enhanced profits from the production of beef.

Urban growth that converts farm land to other uses will continue to put upward pressure on land prices. This will continue to increase the value of farm assets and equity, but will make it difficult for new farmers to purchase these assets. This represents a trend that will likely continue in the future—limited ability to acquire farm land that is increasing in value faster than the income that can be derived from using these lands for agricultural production. *

Construction and Housing

Overview

After eight consecutive years of expansion, the total value of residential and nonresidential construction in Utah declined, falling 2% in 1997 to \$3.37 billion. Despite this slight decline, 1997 recorded the second highest valuation for construction in the state's history. The 12% growth in nonresidential construction valuation in 1997 helped to offset a decline in residential construction valuation of nearly 10%. Housing prices continued to increase, but at a slower rate than the past few years. Although the rate is slowing, Utah's measured price increase over the last year of 7.1% ranks 2nd highest among all states. The 1998 outlook anticipates a near repeat of 1997. Total construction valuation is projected to fall slightly to \$3.2 billion. Nonresidential construction activity is projected to increase about 3% to \$1.1 billion. Residential construction valuation is projected to fall 7%, from \$1.9 billion in 1997 to \$1.76 billion. The number of building permits issued for new dwelling units is projected to decline from 20,000 in 1997 to 17,700 in 1998. Housing prices are expected to level off to about 5% annual increases over the coming years.

1997 Summary

Residential Construction. Utah's longest residential construction boom ended in 1997 as the number of building permits issued for new dwelling units declined 16%. An estimated 20,000 permits will be issued for new dwelling units in 1997 down from the all-time high of 23,737 registered in 1996. The 20,000 residential building permits will be divided among single-family units, multifamily units and mobile homes/cabins. The number of building permits issued for single-family units in 1997 will be approximately 13,800, for multifamily units 5,000 and for mobile homes and cabins 1,200. The total residential construction valuation for these 20,000 units will be \$1.9 billion.

The two most important factors contributing to the decline in residential construction activity are: (1) lower levels of net in-migration and (2) opposition by local residents to new apartment construction. Lower levels of net in-migration are a reflection of the slowdown in Utah's job growth over the last three years. New job opportunities attract people and when job growth slows down, net in-migration also slows down. Lower net in-migration reduced the demand for new housing and combined with local opposition to new apartment construction, led to a decrease in new residential construction activity.

The decline in residential construction activity has been generally widespread throughout the state. Nineteen of the state's twenty-nine counties had lower levels of residential construction in 1997 than in 1996. There are a few notable

exceptions, however, such as Weber, Tooele and Box Elder Counties. These counties had significantly higher levels of activity due to lower land costs, which has attracted homebuilders and increased construction activity. Consequently, residential construction in Tooele County is up 105% compared to 1996 and Weber County is up 37%. The list below gives the percent change in residential construction activity through the third quarter of 1996 and 1997 for selected counties:

- ✿ Box Elder, +36.9%
- ✿ Davis, +1.0%
- ✿ Tooele, +105.5%
- ✿ Weber, +37.3%
- ✿ Cache, -26.9%
- ✿ Grand, -10.0%
- ✿ Iron, -45.1%
- ✿ Salt Lake, -35.3%
- ✿ Summit, -44.5%
- ✿ Utah, -8.9%
- ✿ Washington, -18.4%

Nonresidential Construction. Since 1991, the valuation of nonresidential construction in Utah has risen each year, increasing from \$342 million in 1991 to nearly \$1.1 billion in 1997. The 12% increase in 1997 pushed nonresidential construction valuation to an all-time high. The largest project reported in 1997 was the Little America Grand Hotel in Salt Lake City, which was issued a building permit for \$130 million. Due to the Little America Grand Hotel, the Hotels and Motels sector of nonresidential construction had the highest level of activity and the greatest increase over 1996 levels. In 1996 the construction valuation for new hotels and motels was \$64.8 million compared to nearly \$200 million in 1997. Construction activity for stores and other mercantile buildings also increased, climbing from \$130.9 million in 1996 to \$180 million in 1997. Those major nonresidential sectors that experienced lower levels of activity in 1997 were office and professional buildings and industrial buildings.

The state's nonresidential construction activity is highly concentrated in the northern metropolitan counties. In 1997, an estimated 85% of nonresidential construction activity occurred in the four northern metropolitan counties. Salt Lake County alone accounted for over 50% of all nonresidential construction activity in the state in 1997.

Nonresidential construction does not include highways, bridges, dams, and power plants, i.e., construction that does not include buildings. Therefore, highway and road construction expenditures for projects such as I-15 are not included in nonresidential construction valuation.

1998 Outlook

Residential Construction Outlook. The number of building permits issued for new dwelling units in Utah is projected to fall from 20,000 in 1997 to 17,700 in 1998. The residential construction valuation in 1998 is projected to be \$1.76 billion. Well over half the decline in new units will be in the multifamily sector. Multifamily construction activity may drop as much 40%, from 5,000 new units in 1997 to 3,000 new units in 1998. Permits issued for new single-family construction will be between 13,000 and 14,000 units, and close to the 13,800 permits issued in 1997. There may be some minor weakness in this sector due to lower levels of net in-migration and an increasing inventory of unsold existing homes. Nevertheless, favorable mortgage rates and continued growth in the Utah economy should support new single-family construction activity of more than 13,000 units.

Nonresidential Construction Outlook. The value of nonresidential construction will rise slightly, increasing from \$1.07 billion in 1997 to \$1.1 billion in 1998. Nonresidential construction valuation will be pushed to a record level by the \$240 million LDS Church Assembly Hall. Other large projects that contribute to the high level of nonresidential activity are: the first phase of the Salt Lake City International Airport (terminals and two new concourses), the \$120 million Olympic Village at the University of Utah and the \$150 million reconstruction of the McKay-Dee Hospital.

Significant Issues

Local Opposition to High Density Housing. A disproportionate decline in multifamily construction characterized residential construction activity in 1997 and will also characterize residential construction in 1998. Multifamily construction fell by more than 30% in 1997

whereas single-family construction fell by only 8%. Although lower levels of net in-migration have reduced the demand for new apartment construction, the primary cause of the substantial decline in multifamily activity has been the opposition to high density housing by local residents and the unwillingness of planning commissions to permit new apartment buildings. Local opposition is becoming a serious threat to the rental housing market. If the supply of apartments continues to be suppressed by local opposition to new projects, rental rates will rise more rapidly than they otherwise would, thereby increasing housing cost for those least able to afford it.

Housing Prices and Affordability. Housing price increases in Utah, as measured by the Housing Price Index (HPI) of the Office of Federal Housing Enterprise Oversight have begun to slow down. Nevertheless, Utah's measured price increase in the last year of 7.1% ranks 2nd highest among all states. In the past five years, the HPI for Utah has risen 74.4%, the greatest increase among all states. Despite the recent rise in prices, any crisis in housing affordability is primarily limited to first-time home buyers and low-income renter households.

In the broader context of all households, price increases have not been all that detrimental to housing affordability in Utah nor have they curtailed demand for housing or prevented increases in home ownership rates. The recent run-up in prices is one of those relatively short-term distortions that characterize housing markets. There are signs that a correction may be underway. Price increases appear to have slowed down in the past 12 months and for the next few years will probably settle around Utah's long-term average price increase of about 5% a year. *

Overview

News concerning Utah's defense industry has grown less dramatic as the effects of national military realignment decisions level off. Defense spending in Utah in 1996 totaled \$1.3 billion, down nearly 9%. Continued declines in defense spending both nationally and locally, the closing and redevelopment of military facilities, and continued threats to Hill Air Force Base will continue to dominate defense issues in the coming years.

Trends

Current budget projections developed by the Congressional Budget Office show the total defense budget increasing slightly from \$266 billion in 1996 to \$287 billion in 2000. While these absolute amounts (both actual and projected) have increased since 1995, the percentage of defense spending relative to the overall economy has decreased. As a percent of gross domestic product (GDP), defense spending was 3.8% in 1995, 3.5% in 1996, and is projected to decline continuously to 2.9% in 2006. Table 76 and Figure 44 track the history of national defense spending.

The importance of defense spending in Utah's economy has declined relative to that of the nation, and will likely continue down this path. Total defense spending in Utah currently stands at \$1.3 billion—down nearly 9% from 1995. As a percent of the Gross State Product (GSP), defense outlays have diminished from a high of over 8% in 1987, to less than 3% in 1996. Table 77 and Figure 45 illustrate the history of defense spending in Utah.

Private Contracting Activity. Defense contracts to private firms have decreased considerably at both the state and national level throughout the 1990s. As shown in Table 77, total procurement contracts to Utah firms dropped 20% from 1995 to 1996, continuing a downward trend begun in 1988. While Thiokol remained the state's top contract recipient in 1996, these awards have declined from a peak of \$587 million in 1987 to \$38 million in 1996. The company cut 200 jobs in 1997 due to restructuring. Former defense giant Hercules, once the recipient of \$353 million in contracts (1986), sold its aerospace division to Minnesota-based Alliant Techsystems in March 1995, and its Composite Products division to California-based Hexcel in 1996. Alliant was Utah's second largest defense contractor in 1996, with \$33 million in contract awards. Other major defense contractors include Litton Industries (navigational instruments) and Evans and Sutherland (operational training devices), both in Salt Lake City, and Utah State University (research and development) in Logan.

Geographic Distribution. Table 78 presents 1996 defense spending by county, and compares the 1996 total with the

1995 total. Federal defense spending in Utah is concentrated in Davis, Salt Lake, Tooele, and Weber counties, with significant spending occurring in Box Elder, Cache, and Utah counties. Payroll and procurement at Hill Air Force Base accounted for over 90% of defense spending in Davis County. Contracting activity associated with a variety of weapons systems and other projects accounts for most of the defense spending in Salt Lake County. Payroll and procurement at Tooele Army Depot and Dugway Proving Grounds account for over 60% of spending in Tooele County. Of defense spending, 70% in Weber County goes to Defense Depot Ogden.

Military Facilities. With major decisions made and plans for redevelopment of closed military facilities in the works, the future of Utah's military facilities is much more certain than in years past. Defense Depot Ogden (DDO) was designated for closure by the Defense Base Closure and Realignment Commission (BRAC) in 1995, and was officially closed in September 1997 after 56 years of operation. Ogden City will sublease the empty buildings for business and warehouse space, and adjacent land has been designated for development as an industrial and business park. The project could create as many as 10,000 jobs.

Workforce reductions at Tooele Army Depot (TAD) amounted to nearly 500 lost jobs in 1997, bringing the total number of jobs lost to reductions in force and realignment since 1988 to 2,400. The current workforce at TAD stands at 600 employees, while another 200 work at the chemical weapons incinerator. A local development firm has been created to turn the surplus military land near the city of Tooele into a business and industrial park, which is expected to create 1,700 jobs by 2001.

Hill Air Force Base (HAFB), the state's largest basic employer and last of the big military installations in the state, continues to defend threats from federal cutbacks. Hill's proponents in Washington were recently victorious in passing a defense spending bill which eliminated preferential treatment in the bidding process for competing repair-and-maintenance facilities in Texas and California. The Clinton Administration had attempted to "privatize in place" most jobs at Kelly AFB (California) and McClellan AFB (Texas), essentially skirting BRAC's closure orders and threatening Hill with more job losses. The latest threat comes from the Air Force, which is currently looking at Hill's 388th Fighter Wing for possible transfer to another base. Such a loss would result in the elimination of 2,000 jobs, as well as leave the base vulnerable to further cutbacks. A decision is expected as early as January 1998.

Outlook

With federal defense spending projections declining, the importance of defense to Utah's economy will also continue to diminish. The Defense Department reportedly is looking at more rounds of closures in the next 5 years; however, Congressional opposition is strong. Despite further threats, the worst of the defense cutbacks appears to be over for Utah, and redevelopment is well underway. The rapid

conversion of military facilities at DDO and TAD to commercial use illustrates the strength of the state's economy, as well as its ability to absorb jobs lost from federal cutbacks. The success of these commercial endeavors remains to be seen; but all signs point to a bright future for both projects. Although declining in importance, Utah's defense sector will continue to contribute significantly to both the nation's defense and the state's economy. *

Overview

Production of crude oil and natural gas declined in 1997, while coal production, electric power generation, and uranium production increased. At its currently low level of around \$18 per barrel, the price of crude oil is not enough to spur significant exploration. Local development and production costs are high in Utah, further dampening activity. The combination of increasing natural gas prices and the development of coalbed methane may improve natural gas production in the coming years. Coal production reached a new high in 1997 of 28.6 million tons. Electric power generation rebounded in 1997 because of less hydro power circulating on the western power grid. As the electricity industry becomes more competitive, stable or declining prices will support strong levels of consumption. Utah is once again the nation's number one uranium producing state, producing 43% of total U.S. uranium production. Uranium prices are expected to continue to climb and cause further increases in production in 1998.

The total value of minerals (including coal) produced in the state in 1997 is estimated at \$2.3 billion, \$75 million more than last year. Contributions from each segment are base metals (\$938 million), industrial minerals (\$533 million), coal (\$523 million), and precious metals (\$289 million). The value of mineral production is expected to decline moderately in 1998.

Petroleum And Natural Gas

Utah production of both crude oil and natural gas has been in decline over the past few years. The rate of this production decline, however, has been decreasing, and production may soon stabilize. While crude oil production will increasingly turn to technology as a remedy to slow this decline, natural gas production will look to new sources such as coalbed methane.

1997 Review. Utah crude oil production continued the decade-long decline that began in 1986. Production from oil wells is estimated to fall to 19.2 million barrels in 1997, a decrease of only 1.5% from the 1996 production of 19.5 million barrels. San Juan County again led all Utah counties with 7.1 million barrels of production. Duchesne County remained the second-largest producing county with 6.1 million barrels followed by Summit and Uintah Counties, which each produced 2.9 million barrels. All other counties combined amount to about 1% of total state production. Statewide sales of crude oil were 19.4 million barrels in 1996, and 19.0 million barrels in 1997.

As with crude oil, Utah production of natural gas also declined in 1997. Following a significant production decline at Utah's largest natural gas operation, Anschutz Ranch

East, a 10-year low for gross production of 267 billion cubic feet (Bcf) is estimated for 1997. This was 5% below the 281 Bcf produced in 1996. Marketed production is also estimated to decline in 1997 to 238 Bcf. Despite production declines, Summit County remained the leader in natural gas production with 56% of Utah's production, followed by Uintah, Carbon, Duchesne, and San Juan Counties. Statewide, sales of natural gas were 180 Bcf in 1996 and 171 Bcf in 1997.

Possibly the most critical factor for the future of oil and gas production is the market price. At its current low level of around \$18 per barrel, the price of crude oil in Utah is not high enough to spur significant exploration. Although it is considered unlikely that any large oil field remains undiscovered in Utah, numerous smaller fields may await exploration. Well permits, well completions, footage drilled, and drilling success rates have all shown modest increases in the past few years. Drilling in Utah in 1997 remained strong.

Both development and production costs are particularly high in Utah. Local geology is such that drilling operations require significantly more time than is required in areas such as the Gulf Coast. Relatively deep oil fields and 'waxy' crude in the Uintah Basin add even more to the cost of drilling and production. Additional complications are introduced by the limited number of well servicing companies in the state. As in-state production continues to decline, new support service areas are unlikely to appear. Despite the variety of financial and logistical disadvantages of oil production in Utah, the implementation of innovative drilling and recovery technology may support the industry for years to come. New technology has been so successful, in fact, that production declines appear to be ending. Waterflood techniques are currently tripling the recovery rate of some wells in Duchesne County, and multilateral horizontal drilling is doubling recovery rates in experimental wells in the Aneth area of San Juan County. Widespread incorporation of these and other development technologies are expected to significantly improve the outlook for Utah oil production during the next several years.

Production of refined petroleum products at Utah's five petroleum refineries is estimated to increase slightly in 1997 over 1996 levels. In particular, the Amoco petroleum refinery capacity increase in early 1997 should lead to a greater flow of crude oil and petroleum products. Utah both imports and exports refined petroleum products, with both volumes remaining roughly constant over the past decade.

The combination of increasing natural gas prices and the development of coalbed methane may contribute to a bright future for natural gas production in Utah. Natural gas prices

have been on the increase during the past year and should support new gas production. River Gas has undertaken major coalbed methane operations in Carbon County, and Texaco and Anadarko are expected to soon expand their own operations. New production in this area should not only curb Utah's production decline, but actually boost statewide production over the next few years.

1998 Outlook. Crude oil production should slowly decline over the next few years, but the decline should be less than in past years. Falling an average of 1% each year, crude oil production is estimated to be around 19.2 million barrels in 1997, and projected at close to 19.0 million barrels in 1998. After several years of decline, gross natural gas production in 1998 is expected to remain at the 1997 level. Sales of natural gas in 1998 will increase 10% over the 1997 level.

Significant Issues. Both crude oil and natural gas wellhead prices have been remarkably low over the past few years. Relatively low and stable energy prices play a major role in encouraging increased demand, and energy conservation efforts will remain challenged for years with low prices. Several widely respected forecasting services for the past few years have projected relatively flat and stable oil and gas prices in inflation-adjusted dollars. While the Utah natural gas wellhead price has only gradually recovered from its low in 1995, the Utah crude oil wellhead price has continued to experience downward pressure. With abundant crude oil supplies in the Middle East and other new international sources, this downward pressure is not likely to change. The spot market for natural gas, however, has exhibited some volatility. This was most recently seen in the 1996-1997 winter, although a repeat of the price volatility from last winter is not anticipated for the winter 1997-1998 season. Nevertheless, natural gas price volatility is a seasonal problem and should not obscure the reality of low energy prices and their effect on increasing demand.

Electric Utilities

1997 Review. After 2 years of declining generation, Utah electric power generation in 1997 rebounded, increasing from 32,229 gigawatthours (GWh) in 1996 to an estimated 35,914 GWh in 1997. Coal-fired electric power generation in Utah increased from 30,693 GWh in 1996 to an estimated 34,224 GWh in 1997. The primary force behind the 1995-1996 low generation years was the plentiful hydropower circulating on the Western grid. Since 1994, a relatively dry year which prompted increased coal-fired generation, higher-than-average rainfall in 1995 and a record-breaking level in 1996 have increased the West's demand for low-cost hydropower at the sacrifice of more costly fossil-fired generation. Currently, coal-fired generation in Utah accounts for some 95% of total electric power generation. Coal-fired generation is supplemented by minor contributions from local hydropower, petroleum, natural gas, and geothermal sources.

Excess hydropower resources will continue to exert a strong

influence on coal-fired power production in Utah. However, new market forces in the increasingly deregulated market will likely have an equally important effect. One example is the "excess" power contract recently signed between the Intermountain Power Project (IPP) and several of its California customers. Including these excess power sales, IPP production has increased from 10,386 GWh to 13,365 in 1997. Though IPP accounts for only one-third of total Utah coal-fired production, this rise of nearly 30% has increased total fossil-fuel generation to an estimated 34,497 GWh in 1997 from 31,017 GWh in 1996.

Demand for electricity in Utah has slowed in 1997 compared to the record growth in 1996. Following the 8% increase in sales between 1995 and 1996, estimates for 1997 show an increase of 2%. By sector, commercial demand in 1997 registers the highest rate of growth, at 6%, and will likely consume 6,426 GWh by year's end. Residential demand in 1997 is expected to increase to 5,650 GWh, with half the growth rate of the commercial sector. Industrial demand for electricity will likely show a decrease, at less than 2%, falling from 7,423 GWh in 1996 to 7,292 in 1997.

1998 Outlook. For 1998, growth in residential electricity consumption will track the state's strong rate of population growth. In spite of technology and home building improvements, residential electricity consumption is likely to increase as consumers continue to purchase more electric appliances. Indeed, appliance growth rates, as high as 6% annually over the last decade, will likely establish appliances as the most demanding use of electricity in Utah households. Still another contributor to high consumption is the trend toward larger new homes that require more electricity for cooling and lighting.

Over the past 7 years, Utah's particularly strong economy has witnessed a 10% average annual growth in retail trade. This remarkable trend has fueled high electricity consumption rates in the commercial and industrial sectors and will continue to increase consumption over the next year. While commercial sector electricity intensity (energy use per square foot) remains relatively stable, commercial construction is the primary contributor to increased consumption. In addition, the increased use of electricity-intensive technologies such as computers, faxes, and medical imaging devices will likely continue to offset new efficiency gains.

For the industrial sector, three primary factors will influence future consumption pattern: prices, economic growth, and energy efficiency. As the electricity industry becomes more competitive, stable or declining prices will support strong levels of consumption. Increased efficiency in manufacturing processes and strong economic growth will further bolster demand through the next year and into the next century.

Significant Issues. Both the deregulation of the electric power industry and the effect of climate change policies will

be significant issues for the electric utility industry. While the precise nature of their effect is unknown at the current time, both deregulation and climate change should present a challenge for the Utah electric utility industry with respect to power generation, utility fuel mix, and ultimately end-use consumption.

Coal

Utah coal production, which had been on the rise for the past five years, hit a new high of 28.6 million tons in 1997. Employment also increased from 2,077 in 1996 to 2,168 in 1997. Coal production from Carbon County decreased while Emery and Sevier registered higher levels of production. More than 95% of total production came from federal land. The value of coal produced surpassed \$523 million.

1997 Review. In 1997 Utah produced 1.5 million tons of coal above the 1996 level at an all-time high of 28.6 million tons. The Wasatch Plateau coal field, with production of 24.2 million tons, was the major coal-producing field in central Utah. The other coal field, Book Cliffs, produced 4.3 million tons. Emery County produced the most coal in Utah (18.4 million tons) followed by Carbon (5.5 million tons) and Sevier (4.6 million tons). Federal land accounted for almost 96% of Utah coal production.

The export market was the major contributor to the increase in Utah coal production, followed by the electric utility sector. The industrial sector, both outside of Utah as well as in Utah, contributed a small amount to the increase in production. Major consumers of Utah coal were the state of Utah (13.2 million tons), followed by the Pacific Rim countries of Japan, Korea, and Taiwan (6.1 million tons), California (3.0 million tons), Nevada (2.3 million tons), Tennessee (2.1 million tons), and Illinois (1.8 million tons). Eight other states also consumed smaller amounts.

1998 Outlook. Coal production in Utah should reach an all-time high of 28.9 million tons in 1998. Productivity should increase by about 1.5%. Coal prices should start to turn around though the increase would be small.

Significant Issues. Electric utility deregulation undoubtedly will set in motion forces, by far much greater than any in the previous decade, which would affect the coal industry/electric utility relationship. The increased vertical integration of electric utility with coal-producing companies would bring about a more efficient entity. This entity could compete better in the new deregulated environment.

The approaching second phase of Clean Air Act Amendments of 1990 would force the creation of a bigger market for high Btu, low-sulfur coal found in Utah. Global climate change, however, could adversely affect the consumption of coal. This will affect low-Btu coal much more than high-Btu coal.

As a result of a high degree of mechanization, a highly

skilled work force and very favorable geology, productivity continues to rise in the Utah coal industry. In 1997 for the first time, productivity of Utah coal miners rose above 7 tons per man-hour. Utah coal production should continue to rise for the foreseeable future, and coal prices should make a turnaround and start to increase.

Uranium

1997 Review. Uranium production in Utah in 1997 is on the rebound. Aside from the 1991-1994 time period, Utah has been a major player in U.S. uranium production and will most likely continue to be a major player in the near future. In 1986, Utah production represented 43% of the total U.S. uranium production. During 1991 the persistence of a national glut of uranium caused the price to fall below \$10.00 per pound, which resulted in the cessation of domestic uranium production. By 1995, the market strengthened and Utah regained its "number one uranium-producing state" status with production at 1.6 million pounds at the White Mesa Mill in Blanding. In 1996 Utah uranium production declined to 700,000 pounds, which represented about 11% of total U.S. production. The price of uranium in 1997 is fluctuating in the \$11.00 per pound range. In May 1997 the White Mesa Mill of Energy Fuels Nuclear will produce about 600,000 pounds of U_3O_8 in 1997 from alternative feed, which it received from Allied Signal of Metropolis, and also by using ore from the Arizona Strip and the Colorado Plateau.

1998 Outlook. With prices expected to increase from \$12.48 in 1997 to \$14.31 in 1998, Utah uranium production should steadily increase. During 1998 the White Mesa Mill of International Uranium Corp. could produce at least 100,000 pounds of uranium. It is also very likely that another 650,000 pounds of uranium could be produced using uranium ore from the Arizona Strip and Colorado. International Uranium Corp. could produce as much as 750,000 pounds of uranium in 1998, and U.S. Energy Corp. could produce 150,000 to 250,000 pounds. In total, Utah uranium production should be about 600,000 pounds in 1997, increase to 900,000 pounds in 1998, and reach 1.9 million pounds in 1999. International Uranium Corporation could produce as much as 750,000 pounds of uranium in 1998, as well as producing about 3 million pounds of vanadium, and could provide employment for nearly 100 people. U.S. Energy Corp. could also obtain all the regulatory approvals to change the status of the Shootering Canyon Mill from "stand-by" to "operating." As such, the mine could produce 150,000 to 250,000 pounds of uranium and provide employment for 20 people in the mill in addition to as many as 40 people in the Tony-M mine.

Minerals Overview

The total value of minerals (including coal) produced in the state of Utah in 1997 is estimated to be \$2.3 billion, \$75 million more than last year. Contributions from each segment of the industry are: (1) base metals - \$938 million, (2) industrial minerals - \$533 million, (3) coal \$523 million,

and (4) precious metals - \$289 million. Base- and precious-metal production was relatively high, while prices were lower for most metals. Coal production established a new record-high production level as prices declined slightly. Industrial mineral production reached new highs in several commodities while prices increased modestly for some commodities and decreased for others.

The U.S. Geological Survey ranked Utah seventh in the nation (down from fourth) in the value of nonfuel minerals produced in 1996. Utah accounted for nearly 4% of the U.S. total nonfuel mineral production value.

The state has 63 active large mine operations (excluding sand and gravel) which are grouped by industry segment as follows: base metals - 3, precious metals - 2, coal - 12, and industrial minerals - 46. Ninety-six small mines reported production in 1996.

Through the end of November, the Utah Division of Oil, Gas and Mining received five Large Mine permit applications (five acres and larger disturbance) and 29 new Small Mine permit applications (less than five acres disturbance).

New mines which are in early development include two relatively small copper mines and one lead, zinc, and silver mine. In addition, one new coal mine completed its first full year of operation and two additional coal mines are being planned. Two industrial mineral quarries were opened in 1997 and two additional quarries will open in 1998.

Mineral exploration statewide is expected to be slightly higher in 1997 than in 1996. Thirty-two Notices of Intent (NOI) to explore on public lands were filed with the Division of Oil, Gas and Mining through November 1997, compared to 32 for all of 1996, and 22 for 1995.

Operator surveys indicate that base-metal production should remain relatively steady in 1998 while a sharp decline in gold production is expected; coal production will increase as will most industrial mineral commodities. An accelerated decline in base- and precious-metal prices which began in the fourth quarter of 1997 could impact those metal values in 1998 if the trend continues.

1997 Summary

The value of Utah's mineral production in 1997 is estimated to be \$2.3 billion, an increase of \$75 million from 1996, making 1997 the second-highest year in total value after 1995. Contributions from each of the major industry segments are:

- * base metals, \$949 million (41% of total);
- * industrial minerals, \$533 million (23% of total);
- * coal, \$523 million (23% of total); and
- * precious metals, \$289 million (13% of total).

The changes in Utah's mineral valuation by industry segment for the period 1995-1997 is shown in Figure 46. Compared to 1996, the 1997 values of: (1) base metals

decreased \$11 million, (2) industrial minerals increased \$100 million, (3) coal increased \$23 million, and (4) precious metals decreased \$37 million. Prices decreased for most base metals (copper, molybdenum, and magnesium) in 1997, while precious-metal prices were mixed; silver prices increased while gold prices decreased. Coal prices declined slightly in 1997. Industrial mineral prices increased modestly for most commodities but were lower for several others.

New Mine Permits. Through the end of November 1997, the Utah Division of Oil, Gas and Mining received five Large Mine permit applications (five acres and larger disturbance) and 29 new Small Mine permit applications (less than five acres disturbance). One application was made to change from Small Mine to Large Mine status (limestone quarry). These numbers represent a decrease of four Large Mine permit applications and a decrease of five Small Mine permit applications compared to 1996. New Large Mine permits include two limestone quarries, a gypsum quarry, and a beryllium mine near an existing operation. New Small Mine permits are grouped as follows: (1) industrial minerals - 20, (2) precious metals - 8, and (3) other - 1 (geodes).

Sixty-three large mines (excluding sand and gravel) were active in 1997. These mines, grouped by industry segment, are: base metals - 3, precious metals - 2, coal - 12, and industrial minerals - 46. Ninety-six small mines reported production in 1996 (latest data available). Small mines are grouped as follows: industrial minerals - 66, gemstones - 13, precious metals - 11, fossils - 3, and other - 3.

National Rankings. The U.S. Geological Survey ranked Utah seventh in the nation (down from fourth) in the value of nonfuel minerals produced in 1996. Utah accounted for nearly 4% of the U.S. total nonfuel mineral production value. Utah ranked:

- * first in beryllium, and gilsonite;
- * second in potash, molybdenum, and copper;
- * third in gold, and magnesium metal;
- * fourth in phosphate rock, magnesium compounds, and silver;
- * sixth in salt; and
- * seventh in bentonite clays.

Mineral Production Trends

According to the U.S. Geological Survey, between 1986 and 1996 the value of nonfuel mineral production in Utah ranged from \$374 million to over \$1.8 billion (Figure 47). The total for 1996 (latest data available) represents the second-highest for nonfuel mineral valuation for the state, \$280 million less than 1995, the year of record mineral production. The Utah Geological Survey's estimate for nonfuel mineral production for 1997 is \$1.8 billion, nearly \$100 million more than 1996.

Mineral exploration statewide is expected to be slightly higher in 1997 than in 1996. Thirty-two Notices of Intent (NOI) to explore on public lands were filed with the Division

of Oil, Gas and Mining through November 1997, compared to 32 for all of 1996, 22 for 1995, 34 for 1994, and 54 for 1993.

Base and Precious Metals

Base-metal production was the largest contributor to the value of minerals produced in 1977. In descending order of value, those metals are: copper, magnesium metal, molybdenum, and beryllium. Precious metals produced in descending order of value are gold and silver.

Copper. Copper production from Kennecott's Bingham Canyon mine will increase slightly in 1997 from 1996 production of about 330,000 tons of copper metal. The Bingham Canyon mine is the largest copper mine in the U.S.

Magnesium Metal. Magnesium is produced from Great Salt Lake brines by Magnesium Corporation of America (Magcorp). Magcorp's plant has a capacity to produce 42,000 tons of magnesium metal (99.9% purity) annually and is the fourth-largest magnesium plant in the world. Production in 1997 was at or slightly above capacity.

Beryllium. Utah continued to be the nation's largest producer of beryllium metal. Beryllium ore (bertrandite) is mined at Brush Wellman's Topaz mine and processed with domestic and imported beryl at the company's plant a few miles north of Delta. Beryllium hydroxide is produced at the Delta plant and sent to the company-owned refinery and finishing plant in Ohio.

Molybdenum. The sole molybdenum producer is Kennecott's Bingham Canyon mine, which will produce about 19,000 tons of molybdenum concentrate (MoS_2) in 1997. The Bingham Canyon mine was one of only 11 molybdenum producers in the U.S. in 1997.

Gold and Silver. Gold production reached a record-high of nearly 800,000 Troy ounces in 1997. Gold is produced from three surface mines, two primary producers and one byproduct operation. In descending order of production they are: (1) Kennecott's Bingham Canyon mine, (2) Kennecott's Barney's Canyon mine, and (3) American Barrick's Mercur mine.

In 1997, silver production statewide is estimated to be about 4.8 million Troy ounces, the same as last year. Silver is produced as a secondary metal at the Mercur mine and as a byproduct metal from the Bingham Canyon mine. The Bingham Canyon mine is by far the largest silver producer in the state.

Industrial Minerals

The industrial minerals segment was the second-largest contributor to the value of minerals produced in 1997. Major commodities produced by group or individual commodity in descending order of value include:

✻ salines, including sulfate of potash, salt, potash, and

magnesium chloride;
✻ sand and gravel, and crushed stone;
✻ Portland cement;
✻ phosphate;
✻ lime;
✻ gilsonite;
✻ clay and bentonite; and
✻ gypsum.

Sulfate of Potash, Salt, Potash (Potassium Chloride), and Magnesium Chloride. Brine-derived products including salt are the largest contributors to the value of industrial mineral production in Utah. The production of these commodities is estimated to be 2.7 million tons in 1997, 400,000 tons less than in 1996. Sulfate of potash (SOP) is produced by GSL Minerals, Inc., one of the largest suppliers of SOP in North America. Salt production alone is estimated to be 2.0 million tons with most of the production from three operators using brine from Great Salt Lake. These operators, in descending order of production are: (1) GSL Minerals, Inc., (2) Morton Salt Company, and (3) Cargill Salt, Inc. In addition, three other companies produce salt and/or potash from operations not related to Great Salt Lake: (1) Reilly Chemical Company, (2) Moab Salt Company, and (3) Redmond Clay and Salt Company (salt only). Potash (KCl) is produced by two operators, Reilly Chemical Company and Moab Salt Company.

Sand and Gravel, and Crushed Stone. Sand and gravel, and crushed stone (including limestone and dolomite) are the second-largest contributors to the value of industrial minerals produced in 1997. These materials are produced by commercial operators, and by state and county agencies in every county in Utah. Data compiled by the U.S. Geological Survey show that in 1996 over 30.2 million tons of sand and gravel and 4.0 million tons of crushed stone were produced with a total value of \$117.4 million. Mid-1997 data indicated that production has increased substantially above the mid-1996 level.

Portland Cement. Two operators produce Portland cement in Utah: Holnam, Inc. and Ash Grove Cement Company. The two plants have a combined capacity of more than 1 million tons of cement annually. Both companies have plans to increase cement production over the next several years.

Phosphate. Utah's only phosphate producer is SF Phosphates Limited. The company mines roughly 2.5 million tons of ore annually, which is processed into about 1 million tons of concentrate and transported in slurry form to the company's Rock Springs, Wyoming, fertilizer plant. The mine operates at a nearly constant annual rate since its product is used exclusively in its company-owned fertilizer plant. Production in 1997 is the highest in the past six years.

Lime. Lime usage continues to expand. Continental Lime, Inc, which produces high-calcium lime, and Chemical Lime of Arizona, which produces dolomitic lime, are the two

suppliers of calcined limestone (quick lime) and hydrated lime in Utah, with a combined capacity of nearly 550,000 tons per year. Continental Lime's plant is rated one of the ten largest lime plants in the U.S.

Gilsonite. Gilsonite production in 1997 is estimated to be more than 60,000 tons, the same as in 1996. Gilsonite is an unusual solid hydrocarbon which has been mined in Utah for more than 100 years. The three operations which produce gilsonite, in descending order of production are: (1) American Gilsonite Company, (2) Zeigler Chemical and Minerals Company, and (3) Lexco, Inc.

Clay and Bentonite. Nearly 175,000 tons of common clay and over 40,000 tons of bentonite were produced by four companies in 1997, a slight decrease in clay production and nearly the same bentonite production as last year. In descending order of production the companies are: (1) Interstate Brick Company, (2) Redmond Clay and Salt Company, (3) Interpace Industries, and (4) Western Clay Company.

Gypsum. More than 365,000 tons of gypsum were produced by six companies in 1997, slightly higher than in 1996. In descending order of production they are: (1) U.S. Gypsum Company, (2) Georgia Pacific Corporation, (3) Thomas J. Peck & Sons, (4) H.E. Davis & Sons, Inc., (5) D.K. Gypsum Industries, and (6) Western Clay Company. The majority of gypsum produced in Utah is used for making wall board, but several small operators supply raw gypsum to regional cement plants and to the agriculture industry for use as a soil conditioner.

1998 Outlook

The value of mineral production is expected to decline moderately in 1998. Operator surveys indicate that in 1998; base-metal production should remain relatively high, precious-metal production should decline sharply, and coal production should increase as should most industrial mineral commodities. Metal prices for copper, molybdenum, and

gold are at their lows for the year and could significantly affect the value of base- and precious-metal production if the current trend continues. Precious-metal production will be significantly lower in 1998 due to mining lower grade gold values at one existing operation and to scaling down of production at the two other operations.

Significant Issues Affecting Utah's Mining Industry

Significant issues which will affect the long term viability of Utah's mineral industry are: (1) the uncertainty over reclamation standards and royalty rates in proposed changes to the 1872 Mining Law, (2) the limited availability of public lands to conduct mineral exploration, especially in Wilderness Study Areas, and (3) the elimination of access to the state's largest remaining coal resource by creation of the Grand Staircase-Escalante National Monument in southern Utah.

Conclusion

Utah's mining industry is producing most major commodities at near-record levels and will continue to produce at high levels for the foreseeable future. The notable exception is gold production. There are currently three active gold producers, down from a recent high of five. One mine will cease production in 1999 and another will begin phasing out over the next few years. Proposed new mine developments are expected to add only a modest amount of precious-metal production, mostly silver. Current prices for base- and precious-metals are approaching multi-year lows and could have a moderate affect on mineral values in 1998. On the upside, both coal and industrial minerals continue to set production records. Several new operations began in the past year and several more are planning to open over the next two years. Many industrial mineral prices are at or near their historical highs which is encouraging new developments and expansion of existing facilities. Coal prices are at a 15-year low, but should improve in 1998. Two new coal mines are being planned which will help maintain record- and near-record production levels for the next several years. ✻

High Technology

Overview

High technology activities continue to be a mainstay of Utah's economy. By year-end 1997, Utah's high technology sector included more than 460 companies and a work force of roughly 40,000. One of the most exciting aspects of the high technology sector is the ever-changing mix of companies and activities.

Technological advances and demand for new and more powerful products drive high technology companies. As technologies change, certain segments of the high technology sector gain or lose importance as sector leaders. In Utah, significant changes in the high technology sector have occurred with employment losses in aerospace, the rise and fall of software, and rapid growth in automotive components. Overviews of several large segments of Utah's high technology sector are provided here.

Aerospace Components

Restructuring and diversification efforts continue in the aerospace sector. Employment in this component of Utah's high technology base, once the largest single high technology sector, has declined steadily over the past ten years. By year-end 1997, aerospace employment is estimated to be less than 6,500 people.

Most of the decline in the high-tech aerospace base is due to the nature of the activities conducted at Utah-based facilities. Aerospace-related companies in Utah are almost all concentrated in the manufacture of guided missile and space vehicle propulsion units and parts. Much of this activity was initially financed through the Department of Defense. The end of the Cold War slowed the robust aerospace industry that had significant impacts on Utah aerospace companies. Since the end of 1990, employment in the aerospace sector has declined by roughly 5,500 people.

Nationally, due to reductions in missile production and stagnant defense budgets the missile sector of the aerospace industry will face continued consolidation well into the next century. Despite the lackluster performance anticipated in the sector at the national level, the worst is likely over for Utah operations. The largest aerospace companies in the state have already been through major restructuring and consolidation. Over the past several years many have begun diversifying their efforts to take advantage of growth in international markets, specifically Asia and Europe. Employment in the aerospace sector should remain at or slightly below present levels throughout the rest of this decade.

Automotive Products

The automotive product component of Utah's high technology sector was nonexistent until the Morton Thiokol split and establishment of Morton International Automotive Safety Products in 1989. Subsequent growth in this component of Utah's high technology sector has been phenomenal. The largest employer in the sector is Autoliv, Inc., a company formed by a 1997 merger between Sweden's Autoliv AB, and Morton International Automotive Safety Products. The remaining company, Autoliv, Inc. is the world's largest supplier of automotive safety systems. The company's primary focus in Utah is the development and manufacture of air bags for the automobile industry.

Five years ago air bags were a growth market. Utah benefitted from broad expansion in the air bag market. Employment in the automotive products sector is expected to reach 6,100 by the end of 1997, an increase of nearly 5,400 people in five years. Beginning in 1996, market saturation in the U.S. and falling prices pushed some air bag manufacturers out of the market and forced the consolidation of others. Over the past two years, the number of major air bag manufacturers has dropped from seven to five. However, Utah has successfully retained its position in the market with the construction of three new automotive safety products facilities under the Autoliv, Inc. umbrella.

The long term forecast for the automotive products sector holds some uncertainty. No new major growth markets currently exist for air bag manufactures; however, demand for air bags in Europe and Asia will provide some expansion for a short time as air bag installation in these markets has trailed the U.S. However, supply is rapidly catching up with demand even in these markets. Some downturn potential could be mitigated with the development and introduction of a "smart bag" (an air bag system that uses sensors to build a three-dimensional picture of a person or object in a seat and automatically adjust deployment accordingly). Utah manufacturers are well-positioned to take advantage of the automotive products market. Although employment growth may be slower in the future, this component of Utah's high technology sector should remain strong.

Biomedical and Medical Products

The biomedical and medical products segment is one of the most well established and stable of Utah's high technology sector. Estimates for 1997 show a continuance of a five-year growth trend with employment exceeding 4,500 workers. Nationally, the U.S. medical instruments and supplies industry is one of the fastest growing manufacturing sectors in the U.S. economy. Strong growth from overseas markets, primarily Western Europe and Japan/Chinese economic areas has spurred growth in the biomedical/medical sector.

Utah companies are well positioned to take advantage of this growth with the presence of both large national medical manufacturing concerns and home-grown medical companies such as Ballard Medical, Research Industries Corporation, and Utah Medical Products. Genetics research activities continue to be an important component of the biomedical and medical supplies sector. Of special note is Myriad Genetics, a company established in 1991 that has become a leader in discovering causes of hereditary diseases. Since its inception, Myriad Genetics has discovered genes that signal a predisposition to breast and ovarian cancer in women. Presently, Myriad Genetics employs approximately 215 people in Utah.

The biomedical and medical supplies sector should continue to do well over the next five years. Forces driving this growth include a less adversarial regulatory environment, consolidations, strong foreign demand, and increased access to rapidly growing markets in Asia and Latin America.

Software Systems

Consolidations and restructuring in Utah's computer software companies continue to exact a toll on the software segment of the high technology sector. Since peaking in 1992 at more than 11,000 people, employment in software firms has been steadily declining over the past five years to approximately 7,000 people in 1997. At the national level, the U.S. computer industry has remained a commanding market force with worldwide sales growing throughout 1996. The Utah experience has been less rewarding. The dissolution of the merger between two software giants,

Novell, Inc. and WordPerfect Corporation in 1996 brought a significant decline in employment within the sector. In 1997, total employment at Novell, Inc. and Corel (formerly WordPerfect Corporation) was 2,850, less than half the reported 5,900 in 1992. However, despite major restructuring, Novell remains one of the top 10 software suppliers in the world.

Over the long-term, employment in the software sector should stabilize between 6,000 and 6,500 employees. Analysts expect an annual growth rate of 11% in the software market through 2002. And, while it is unlikely they will repeat the rapid growth that occurred in the late 1980s, Utah still has a solid base of computer software companies well-positioned to take advantage of this growing industry segment.

High Technology Outlook

High technology activities have been, and will continue to be a driving force in Utah's economic picture. Employment in the sector has remained stable at 39,000 to 40,000 workers despite significant fluctuations in specific segments. However, this employment range should remain steady over the next two years. The competitive nature of the high-tech sector itself will be the largest impediment to growth into the next decade. Nearly every major segment of the high-tech sector is undergoing rapid transition. Expansion often is dependent not only on increases in domestic consumption, but on garnering a larger share of the international market. The extent to which Utah companies can anticipate and react to technological changes will play an important role in their viability over the long term. *

Tourism, Travel, and Recreation

Overview

The Utah travel and tourism industry continues to be one of the largest and most important economic activities in the state. An estimated 17 million trips were taken by out-of-state visitors to Utah for leisure and business in 1997. These visitors spent an estimated \$4.0 billion which generated \$292 million in state and local taxes. The travel and tourism industry provided employment for 97,000 workers in 1997, an impressive 7% gain over last year. Implementing the state's long-range tourism planning, monitoring hotel and motel construction and convention activity, tracking the development of the ski industry, and preparing for the 2002 winter Olympic games will dominate tourism issues in the coming year.

Defining Tourism

The World Tourism Organization defines the travel and tourism industry as the activities of persons traveling and staying in places outside their usual environment. Travel may be for virtually any purpose but is generally limited to a length of stay of less than a year. The "usual environment" is meant to exclude regular commuting between home and work or other frequently visited places. The tourism, travel, and recreation sector contributes significantly to the economic and social well-being of the world, national and state economies. The WEFA Group (international economic consultants) estimates that travel and tourism accounts for more than one in every ten jobs worldwide. Nationally, according to the World Travel & Tourism Council, the U.S. travel and tourism industry directly or indirectly generated 10.5% of the U.S. gross domestic product, 11.4% of employment, 9.9% of tax collections and 10.7% of capital investment.

Measurement of the travel and tourism industry is complex since it is not considered an industry in the traditional sense. Rather, travel and tourism is a combination of parts of other industries that provide goods and services demanded while traveling away from home. These industries, to a greater or lesser extent, include entertainment, recreation, restaurants, accommodations, retail trade and transportation services. Additionally, the tourism industry crosses boundaries with construction, manufacturing, services, government, public utilities, real estate, and agriculture. In general, travel and tourism can be considered one of the top five economic activities in Utah, ranking it along with the other major industries of Trade, Services, Manufacturing, and Government.

Tourism in Utah

Utah's tourism industry is diverse, both in terms of types of jobs created, recreational opportunities, and the multitude of natural and man-made attractions. The state has five national parks, seven national monuments, including the

new Grand Staircase-Escalante National Monument, seven national forests, two national recreation areas, and a significant national historic site, Golden Spike N.H.S. These nationally-designated attractions are complemented by 45 state parks featuring scenery, recreation and history. In addition, millions of acres of BLM-administered deserts and rangelands contribute greatly to Utah's "wide open spaces." In an era when open space has become a major concern, the state still provides opportunities for the tourist to experience the vast emptiness and solitude of the West, with the comforts of nearby cities and towns. Many of the attractions and events, although targeted to tourists, also benefit local communities that may not have access to diverse and quality amenities without outside funding.

1997 Summary

Notable events in 1997 include Sesquicentennial re-enactment ceremonies commemorating the arrival of the first pioneers in Utah. Furthermore, the Recreation Fee Demonstration Program, instituted by federal public land agencies took effect in 1997 to continue through 2000. As a result, increased camping fees, higher entrance fees at many national parks and day use fees were implemented for the first time at Mirror Lake Highway, American Fork Canyon, Fish Lake, Joe's Valley, Flaming Gorge, and Glen Canyon.

Significant portions of fee revenues will be applied directly in the area in which they were collected toward infrastructure, maintenance, and visitor service demands resulting from increased visitation. The intention is to spread some of the costs for managing public lands among the people who use them. Banner years 1995 and 1996 brought unprecedented numbers of visitors and revenues to Utah, due to a combination of the statehood centennial year and several large national conventions. Though marked by a flattening of visits to national parks in the Intermountain region, Salt Lake City airport arrivals, and Utah State Park visitation, 1997 will be known as a good year. Highway traffic figures continued to increase in 1997.

Economic Impact. In 1997, an estimated 17 million trips were taken by out of state visitors to Utah for leisure and business. These visitors spent an estimated \$4.0 billion which generated \$292 million in state and local taxes. Growth in traveler spending increased 5.2% on par with growth in GSP for 1997. The travel and tourism industry provided employment for 97,000 workers, an impressive 7% increase over last year. In Utah, travel and tourism employment represents nearly one in every nine employees. Additionally, tourism-related employment and wages increased at a faster rate than overall state employment and wages in 1997, another indication of tourism's increasing importance in the state.

Outlook

With continued economic expansion, both locally and nationally, tourism activity is expected to remain strong and be an important source of growth. In particular, international tourism to the U.S. is expected to increase at twice the rate of domestic tourism through the end of the decade. Utah is well positioned to attract international visitors drawn to national parks, western culture and recreational opportunities. The international market is of particular interest as international visitors tend to stay longer and spend more than domestic travelers. Several factors are expected to contribute to tourism growth:

- ✿ Continued high levels of consumer confidence and willingness to spend on leisure activities
- ✿ Rigorous competition among airlines which results in favorable air fares
- ✿ Increased recognition because of the selection of Salt Lake City to host the 2002 Winter Olympics
- ✿ The growing ecotourism market and increasing interest in heritage tourism, for which Utah is well positioned
- ✿ Popularity of national parks, the American Southwest, and historic and prehistoric sites
- ✿ Growth in the Church of Jesus Christ of Latter Day Saints and consequent increased visitation to church headquarters and sites
- ✿ Increased convention capacity and hotel capacity resulting from increasing supply in hotel rooms and the renovated Salt Lake Convention Center and Ogden Egyptian Center

Factors that may offset tourism growth include the following:

- ✿ National and international economic uncertainties such as currency fluctuations and U.S. dollar appreciation
- ✿ Capacity constraints and overcrowding of popular attractions during the peak season
- ✿ National press that perpetuates the perception that the national parks and recreation areas are full, discouraging visitation that could be directed to lesser-used areas or the non-peak season
- ✿ Degradation of natural resources and the visitor experience
- ✿ Inability to meet the service expectations of destination travelers with regards to quality, convenience, and availability
- ✿ Natural conditions such as fire or inclement weather
- ✿ Overhaul of transportation infrastructure which may deter travel

Significant Issues

Implementing Long-Range Tourism Planning. Since the beginning of his administration, Governor Leavitt has encouraged Utahns to look to the future and become a generation of planners. In 1996, the Division of Travel Development responded with a carefully researched, long-range strategic plan for tourism development. The plan proposed a marked change in tourism economic development—expanding the responsibilities of the Division to include more than advertising and publishing landscapes.

Quality of life for Utah residents, as well as visitors, and extracting greater economic benefits from tourism have become the primary focus of the Division. This means emphasizing *quality earnings* above *visitation numbers*, *destination tourism* instead of *windshield* or *pass-through* tourism, and *career employment* instead of *seasonal employment*.

The strategic plan is constantly being updated as new information becomes available and as the planning environment changes. Utah communities continue to have an opportunity to provide input into the strategic plan through participation in an ongoing community meeting series. In this important implementation phase of strategic planning, the Division of Travel Development conducts three meetings per year that focus on specific tourism issues in selected counties in the state. Representatives from the business and tourism sector, public land managers, and elected officials meet to discuss challenges, trends and opportunities, as well as how the challenges can be turned into opportunities for higher earnings, quality jobs and increased quality of life.

Hotels and Conventions. Hotel construction reached record levels in 1997. In Salt Lake County alone, Hotel/Motel Room supply increased by 17% over 1996.¹ Because supply is increasing faster than demand, occupancy rates ended the year at 71%, down from 73.1% in 1996.² Demand for hotel rooms increased a respectable 8% statewide in 1997, while room rates increased nearly 9% over 1996, both indicators of a healthy hotel market. Success in the convention business has largely contributed to increasing demand and room rates. In the Salt Lake Valley, conventions in 1997, comprised approximately 244,828 delegates with an economic impact of approximately \$224 million.³

Skiing. With 3.04 million skier visits, the 1996-97 ski season proved to be one of the best years for the Utah ski industry, second only to record-breaking 1994-95. These visits represent a 3% increase over the previous year. Increased investments in ski infrastructure also occurred in 1997, estimated at \$30 million due to new installations in the Park City area.⁴ The proportion of resident skiers continues to increase, up 4% from three years ago, to 46% of all skier visits, or 1,396,630 visits in 1996-97. Non-resident skiers continue to contribute significantly in economic impact to the state, with daily expenditures of \$226, up 13% from 1993, and more than three times the average daily visitor spending. For non-resident skiers alone, this amounts to over \$300 million spent annually on food and lodging, ski passes and incidentals.

²Hire, Jim *The Rocky Mountain Lodging Report*

³Salt Lake Convention & Visitors Bureau

⁴Ski Utah estimate

2002 Winter Olympics. With the approach of 2002, the Olympics will become an increasingly important part of tourism in Utah. Increased visibility and mention of Utah is expected to generate curiosity and increased visitation in years before and after the Olympics, although to what extent has yet to be defined.

Conclusion

Major tourism indicators recorded modest growth in 1997, but not at record-breaking levels of banner years 1995 and 1996. Contributing factors include a decline in regional visitation to national parks and unfavorable foreign exchange rates. Skiers came in near-record numbers and new ski investments bode well for the future. Increasing hotel supply has caught up with record-high occupancy

rates, whereas hotel demand continues to increase, along with room rates, both indicators of a healthy lodging sector.

National travel trends point toward increasing interest in ecotourism, heritage tourism, and soft-adventure activities. Utah is well positioned to attract those visitors seeking a higher quality, more unique experience who are willing to pay more and stay longer. By focusing on quality over quantity, tourism, when part of a balanced economic development strategy, can provide higher quality earnings, with fewer of the nuisances often associated with "windshield" tourism. However, capturing the "quality tourist" will not happen on its own, in spite of "free" Olympic publicity but will continue to be part of long-term tourism planning through community input and focused marketing efforts. ✱

Utah's Nonprofit 501(c)(3) Sector

Background

Nonprofit organizations are an important component of economic activity in Utah providing a wide range of services, programs, and client support efforts throughout the state. While this sector exerts a significant impact on the state's economy, reliable information on funding sources, employment, and scope of activities undertaken by nonprofit organizations is largely unknown and in many respects misunderstood.

Information about nonprofits is limited, making it difficult to provide a detailed analysis of the sector. Most information about the structure and performance of the nonprofit sector comes from administrative records filed with the Internal Revenue Service (IRS) and other government agencies. However, nonprofit organizations are, to varying degrees, exempt from many tax laws, reporting requirements, and disclosure requirements that govern for profit organizations. Those reporting requirements that do apply to nonprofits, primarily public disclosure requirements, are often misunderstood and ignored by nonprofit organizations without enforcement penalties.

The IRS is the primary source of information on the nonprofit sector. Using information returns (Forms 990, 990EZ and 990PF) and requests by organizations for tax-exempt status filed with the IRS, a database is compiled known as the Internal Revenue Service Exempt Organizations/Business Master File (IRS EO/BMF). This database is the only source of information on the activities of nonprofit organizations nationwide. It is available free of charge to the public. Furthermore, once an organization has been granted tax-exempt status, it is bound by law to make available to the public copies of its annual reports and most information returns.

While the IRS EO/BMF provides a starting point for analysis of the nonprofit sector, it has many limitations. First, two important segments of the nonprofit community are underrepresented in the database. Religious organizations and their instrumentalities (including church congregations, parochial schools, and missions) are not required to report their activities to the IRS, though they have tax-exempt status. While some religious organizations voluntarily provide information to the IRS, they generally do not provide financial data to the IRS that is open for public inspection. At the state level, no reliable estimate is available on the number of religious organizations or their financial resources. However, as a group, they may constitute one of the largest segments of the nonprofit sector.

Second, the IRS does not require organizations with annual revenues of less than \$5,000 to file for tax-exempt status. Moreover, the IRS does not require nonprofit organizations

with gross receipts of less than \$25,000 to file information returns. Though some small organizations do complete and file a return, the IRS does not record their financial information.

Finally, because of existing tax laws and regulations, the IRS seldom eliminates nonprofits that cease operating from its database. Hence, the number of active organizations is somewhat less than is reported in the database.¹

A Profile of the Nonprofit Sector

Nonprofit organizations fall under Section 501(c) of the U.S. Tax Code. Within this tax code are 25 tax-exempt categories, all of which provide exemption from federal taxes and property taxation at the local level. The range of nonprofit activities is extraordinary and includes organizations providing educational activities and health care services, sponsors of amateur sports events and family history organizations. It also includes trade associations, fraternal associations, and credit unions. Virtually the only thing nonprofit organizations have in common is their limited tax-exempt status.

Based on the IRS data, 6,110 tax exempt organizations were registered in Utah in 1996. These organizations reported revenues totaling nearly \$4 billion. The largest component of the nonprofit sector, using number of organizations and total reported revenues as measures, was the 501(c)(3) category. The 3,650 organizations comprising this segment of the nonprofit sector accounted for almost 60% of total reported revenues in the 1996 IRS database (Table 87).

Characteristics of the 501(c)(3) Segment of the Nonprofit Sector in Utah

Although all nonprofit organizations enjoy tax exempt status, only 501(c)(3) organizations receive additional privileges under U.S. tax law. These organizations are formed to serve broad public purposes and, as such, are the only entities that can receive tax deductible contributions from individuals and corporations. The 501(c)(3) sector is divided into two separate and distinct groups-public charities and

¹This report summarizes a detailed study of the 501(c)(3) sector undertaken by the Bureau of Economic and Business Research (BEBR), University of Utah commissioned by the Utah Nonprofits Association (UNA) with the objective of developing more reliable information about dimensions of the nonprofit sector. The purpose of the study is to give UNA statistically reliable estimates of the size, activities, and economic contribution of 501(c)(3) segment of the nonprofit community. The analysis provided in this report is based on the IRS EO/MBF, information from Utah Department of Workforce Services, and two surveys conducted by BEBR in 1997.

foundations. Public charities include organizations that serve charitable, religious, educational, scientific, and literary purposes. It also includes organizations involved in conducting public safety testing, fostering national or international amateur sports competition and working to prevent cruelty to children and animals. Foundations are separate entities with a 501(c)(3) designation that are generally formed to support the activities described above.

According to the IRS data 3,650 501(c)(3) organizations were registered in Utah in 1996. However, based on extrapolations of survey data compiled by BEBR on inactive organizations, an estimated 2,117 501(c)(3) organizations were active in Utah during 1996. This total includes 1,763 public charities and 354 foundations. This estimate excludes churches, PTA organizations and other organizations known not to be domiciled in Utah. The number of such organizations totaled 894. Total employment in the sector in 1996 was 72,567. Wage and salary payments totaled \$1.7 billion.

Distribution of 501(c)(3) Organizations by Activity

Organizations involved in providing educational services represent the largest single sub sector within the 501(c)(3) community. An estimated 27% of all active 501(c)(3) organizations reported that providing educational programs and services was their primary purpose. The second and third largest sub sectors of activity most commonly provided by 501(c)(3) organizations were philanthropic and social services (Figure 51).

Using employment as a measure, the largest subsector of the 501(c)(3) community was health care services including health care clinics, nursing facilities, hospitals and medical laboratories. Nonprofit organizations involved in this activity employed nearly 32,000 people in 1996, or roughly 44% of all reported employment. The second largest subsector included organizations that provide educational services. Employment in these two sub sectors accounted for nearly 85% of all reported employment in 1996 (Table 88).

Composition of the 501(c)(3) Workforce

Most of Utah's 501(c)(3) organizations are extremely small. Many rely exclusively on volunteer efforts to manage their charitable efforts. In 1996, an estimated 68% of all 501(c)(3) organizations had no employees. More than 90% employed fewer than ten people full-time. Only 1%, or an estimated 21 organizations, employed more than 100 people full-time. Part time workers are a large portion of the employment base in 501(c)(3) organizations. Part time workers accounted for approximately 34% of the estimated workforce of the 501(c)(3) community in 1996.

Employment patterns differ considerably between public charities and foundations. The 501(c)(3) foundations provide significant funding activities in the community, but have few employees and limited payrolls. Almost 87% of Utah

foundations have no employees. Comparatively, of the estimated 1,763 public charities, 55% had no employees.

Volunteer efforts in the nonprofit sector are impressive. Only 16.3% of all 501(c)(3) organizations reported using no volunteers in 1996. The estimated number of volunteer hours donated to public charities and foundations averaged 5,602 per organization, or the equivalent of 2.7 full-time workers.

Revenues and Sources of Support for 501(c)(3) Organizations

Traditionally, support for nonprofit organizations comes from a variety of sources including federal, state, and local grants, individual contributions, fee-for-service revenues. In Utah, government funding plays a significant role in furthering the activities of 501(c)(3) organizations.

In 1996, an estimated 28.2% of all 501(c)(3) organizations received grants from federal, state or local agencies. An estimated 14.5% received reimbursements from federal and state agencies for services rendered, primarily in the form of Medicare and Medicaid payments. Over half the organizations received private support as grants, gifts and contributions from individuals and corporations. An estimated 82% received funding from other sources including interest income, dues, asset sales and event revenues (Figure 52).

Following the pattern of employment, most 501(c)(3) organizations have very small budgets. Of the 2,117 active 501(c)(3) organizations in 1996, an estimated 45.4% had revenues of less than \$50,000. An estimated 91.7% had revenues less than \$1 million. Only 3.0% reported budgets more than \$5 million.

Economic Impact of the 501(c)(3) Sector

In deriving the economic impacts presented in this study, only the export portion of each organization's budget was used to estimate the earnings and employment impacts on the Utah economy that result from activities undertaken by 501(c)(3) organizations.

The direct impacts of 501(c)(3) organizations on the Utah economy are derived from operations, construction and capital purchases. Annually, charitable organizations and foundations spend millions of dollars in the Utah to provide a diverse array of services. These purchases exert an impact on the local economy as employment and earnings, both directly and indirectly.

Earnings and Employment Impacts. In 1996, organizations included in these economic impact calculations spent \$976,563,385 in the Utah economy; \$695,096,453 of this amount was spent for direct labor purchases including wages, salaries and fringe benefits. Of total reported spending, approximately one-third came from

sources outside the state of Utah, primarily from federal programs including Medicare and pass-through funds for Medicaid. Through direct and indirect economic effects,

these purchases generated \$380,255,580 in earnings for Utah households and 15,942 jobs throughout the state. *

Quality Growth Initiatives

Overview

Urban growth has accelerated throughout the State over the past seven years. The State is the 6th most urban state in the country.¹ Most of Utah's urban population, about 75%, lives along the Wasatch Front (comprised of Salt Lake, Davis, Utah, and Weber Counties). Population is also growing rapidly in areas surrounding the Wasatch Front, such as Summit and Tooele counties. Outside of the Wasatch Front, Washington and Grand counties are rural areas that are becoming increasingly urbanized.

Economic growth, in-migration, and high birth rates have placed strains on the State's resources and infrastructure. Leaders must address transportation management, open space preservation, water supply, and air quality issues. In response to these challenges, numerous quality growth initiatives have arisen on federal, state, and local levels. Both government and private entities have been involved in these efforts. With the diversity of quality growth initiatives at all geographic levels, inter-organizational cooperation is essential. Cooperation will require open communication and access to growth-related information. This chapter describes the quality growth initiatives, current collaboration among organizations, and opportunities for increased cooperation.

Federal Initiatives Dealing with Urban Growth

NAAQS. Bills and executive orders have initiated federal programs that deal with urban growth on a nation-wide scale. The Environmental Protection Agency has set new National Ambient Air Quality Standards (NAAQS) that require tighter controls on ozone and pollutant particulate emissions. Regional transportation plans must show that they can meet these air quality standards.

ISTEA. The Intermodal Surface Transportation Efficiency Act (ISTEA) requires that transportation plans and land use plans are consistent. The act also encourages regional governments to balance highway spending with spending on alternative transportation modes. As an incentive, the act funds intermodal transportation strategies which facilitate access to all forms of transportation, including bus, rail, bicycles, and walking.

Federal Grants. Federal grants to improve geographic information systems also provide states with incentives to plan for growth. The State Automated Geographic Reference Center has received a grant from the U.S. Geologic Survey that will be used to integrate Wasatch Front land use and transportation data. This grant also includes educational outreach, which offers Geographic

¹The urban area is defined as that with a population of at least 1,000 people per square mile, or a municipality with at least 2,500 residents.

Information Systems training for local planners.

State-wide Initiatives

The Governor has established state-wide programs that assist local governments in planning for growth. These programs do not implement plans, but provide direction and technical assistance to local governments so that they may prepare their own plans.

Utah Tomorrow. Initiated in 1990 under the direction of a legislative committee, the Utah Tomorrow Strategic Plan is an ongoing effort to measure progress toward specific State goals. It is organized around ten broad subject areas: culture; economic development; education; environment; natural resources and agriculture; free enterprise and regulatory systems; government; health and safety; human services; infrastructure; and justice. An updated report will be published in January 1998.

Rural Programs. The Utah Tomorrow Strategic Plan measures communities' progress in implementing general plans. The Local Government Planning Project and 21st Century Communities are related initiatives that assist rural counties and communities in preparing for future growth and economic changes. The Local Government Planning Project assists counties in the development and adoption of county level general plans which, through public participation, establish the county's values, goals and future direction. This process also serves as a valuable learning experience for county citizens and officials.

While the Local Government Planning Project focuses on counties, 21st Century Communities assists rural cities and towns in preparing for economic and growth challenges of the next century. Governor Leavitt initiated this program, which seeks to prepare for unprecedented residential and visitor growth, create new jobs, diversify the rural economy, and protect rural Utah quality of life. The program plans to set up a Governor's Rural Partnership Board that will set standards and reward communities for their achievement in community planning, economic development planning, physical infrastructure, and community services. When communities have attained certain standards in these areas, the Board will award them with the designation of "21st Century Community." A 21st Century Community may receive signs at the entrance of the town declaring the community's achievements, a cash award, increased economic development value, and preference in state programs.

State-wide Single Issue Initiatives. Some state-wide initiatives focus on one aspect of growth, such as open space or housing.

Utah Critical Lands Conservation Committee. The Utah Critical Lands Conservation Committee acts as a catalyst for locally initiated efforts to conserve critical lands in rapidly urbanizing areas. The committee does not purchase land. It only makes recommendations and assists local governments in open space preservation. *Land Conservation in Utah: Tools, Techniques and Initiatives* is a document published by the committee to provide local governments with land conservation contacts, sample programs, and strategies.

Utah Open Lands. Utah Open Lands is a private, non-profit land trust which uses conservation easements and land grants to provide significant tax benefits for contributing land owners. Operating on a budget of just \$15,000 a year, Utah Open Lands has saved important open spaces worth more than \$16 million. This organization has also raised legislative awareness through conservation bills and functions as a clearinghouse for written information.

HB 295 Affordable Housing Bill. With the passage of the HB 295 Affordable Housing Bill in 1996, the legislature has determined that municipalities and counties should afford a reasonable opportunity for a variety of housing. The bill requires that cities adopt a plan that meets housing needs of moderate income people desiring to live in their community. Moderate income housing means housing occupied by households with a gross household income equal to or less than 80% of the median gross income of the metropolitan statistical area for households of the same size. The housing plan must include: an estimate of the existing supply of moderate income housing located in the municipality or county; an estimate of the future need for moderate income housing; a survey of total residential housing; and an evaluation of how existing zoning densities affect opportunities for moderate income housing. Implementation of HB 295 has an impact on progress toward housing goals of the Utah Tomorrow Strategic Plan.

Regional Initiatives

Future urban growth will have a significant impact on the Greater Wasatch Area, bordered by Brigham City on the north, Nephi on the south, Tooele on the west, and Heber City on the east. A population of about 1.6 million lives within this area. The most populous counties (Davis, Salt Lake, Utah and Weber) have received 83% of the state's growth since 1940. Municipalities and counties within the Greater Wasatch Area share many resources which stretch beyond jurisdictional boundaries, such as air, water, power, roads and open space. In order to understand and address these issues, public and private entities have organized regional quality growth initiatives.

Envision Utah. Formerly named the Quality Growth Public/Private Partnership, Envision Utah cooperates with citizens, business leaders and policy-makers to develop growth strategies. Envision Utah is sponsored by the Coalition for Utah's Future, a private non-profit organization

dedicated to finding common ground for the common good.

In September 1997, Envision Utah presented a *Baseline Scenario* of the Greater Wasatch Area's projected future if current growth trends and policies continue. The Baseline Scenario demonstrated the problem of rapid and sprawling growth in the Greater Wasatch Area¹ by revealing several sobering statistics for the year 2020:

- ✧ A population that would reach 2.7 million, the current size of the San Diego metro area
- ✧ A transportation system that will on average have longer commute times, lower speeds and increased congestion, despite significant investments in light rail and a reconstruction of a major federal interstate
- ✧ Increases in every major air pollutant, despite 25 years of improving air quality in the region
- ✧ The loss of 66,000 acres of irrigated agricultural lands to accommodate urban growth
- ✧ A water and transportation infrastructure price tag of \$12.9 billion²

Utah residents and their leaders must address these issues so that the enviable quality of life currently present will be preserved.

Envision Utah will compare and contrast Baseline Scenario impacts with "Alternative Growth Scenarios." These alternatives modify current transportation infrastructure, land development trends, and growth policies to provide a view of how the Greater Wasatch Area might grow differently. Residents will be encouraged to express their preferences on the alternative growth scenarios through media outreach and town meetings. The public, policy-makers and planners will closely analyze quality of life and fiscal impacts of each alternative growth scenario. This public debate will lead to implementation of a broadly supported growth strategy.

Quality Growth Efficiency Tools. Quality Growth Efficiency Tools (QGET) is a program created by an appropriation from the legislature. The program seeks to improve the quality of information available to plan for Utah's future. QGET has provided technical assistance for the production of Envision Utah's *Baseline Scenario* and will continue to assist in the creation and analysis of alternative growth scenarios. The QGET Technical Committee guides mapping and models subcommittees. The Mapping Subcommittee has prepared maps that provide a visual picture of the Greater Wasatch Area's current status and projected growth. These maps identify transportation, water, sewer, and natural gas infrastructure, as well as commercial, residential, industrial, agricultural and open space land uses. Part of the funding for this work has been

¹ A ten-county area that includes counties in and adjacent to Utah's two northern metropolitan areas of Salt Lake City-Ogden and Provo-Orem

² *Baseline Scenario*, September 1997, Utah Quality Growth Efficiency Tools Technical Committee

provided by the U.S. Geological Survey and geographic data development funding from the State Legislature. The Models Subcommittee is responsible for using existing models to analyze growth and to procure additional technical resources to use in analyzing alternative growth scenarios.

Future Moves. The Future Moves Coalition is a public interest group committed to integrated, regional planning for the entire Wasatch Front that will insure a balanced transportation system. This coalition believes that there is currently a lack of regional vision and too much emphasis on building roads for cars in transportation decisions. The coalition proposes the inclusion of integrated land use/transportation alternatives in Major Investment Studies and Environmental Impact Statements. Alternatives would include the following strategies: more efficient use of existing transportation facilities; land development that encourages pedestrian, bicycle and transit use; mobility options for all people in the region, including those that cannot drive; incentive programs that encourage the use of car pool and the development of pedestrian friendly, transit supported communities; and full public participation in the analysis of land use and transportation alternatives.

Local Initiatives

In addition to the federal, state and regional initiatives described above there are numerous local initiatives being undertaken to deal with the challenges of growth in some of the state largest cities.

Salt Lake City Futures Commission. Local governments have responded to regional economic and demographic changes by setting long range goals, and making specific transportation and urban design plans. Mayor Corradini and the Salt Lake City council created the Salt Lake City Futures Commission in February, 1996. Seventy-five citizens from all across the city volunteered two years of their time to look twenty years into the future, and draft a vision statement describing their ideal city. Subcommittees focused on economics, neighborhoods, the natural environment, the built environment, and the social environment. Each subcommittee prepared a vision statement, assertions, and recommendations that fulfill each assertion. The Futures Commission's plan could be very useful to the Envision Utah Scenarios Committee in the creation of growth scenarios which reflect the concerns and values of residents.

The Gateway Project in Salt Lake City. In addition to visioning, Salt Lake City has taken measures to improve the appearance and accessibility of the primary gateway to the city from the western part of the valley. The project plans to

remove and consolidate rail tracks, and shorten the viaducts which span them. UDOT is providing funds for the project because they will benefit financially from the shortened viaducts and reduction in construction time. The Federal Transportation Association will provide part of the funding because the project provides a site for an intermodal transportation hub which could be serviced by UTA bus and light rail, commuter rail, Greyhound busses, and Amtrak. The Gateway Project will also open up a critical area for retail and housing space.

West Valley City--R/UDAT. A group of advisory architects and planners visited West Valley from November 20-24, 1997, to make planning recommendations for this rapidly growing city. The Regional Urban Design Assistance Team (R/UDAT) considered how to best utilize the Lake Park Corporate Center, the E Center, the Valley Fair Mall, and a planned intermodal transportation center. In addition, the group addressed the community's ethnic diversity by recommending the creation of an International Marketplace.

Technical Assistance

In June of 1997, the State Automated Geographic Reference Center received funds to further develop mapping capabilities that project impacts of land use and transportation policies. This group is working with Quality Growth Efficiency Tools to project current trends and possible changes in current trends due to alternative forms of urban growth.

The Energy and Geoscience Institute, based at the University of Utah, possesses broad-based capabilities in the digital mapping sciences. Currently, this organization is developing a model that quantifies the results of sustainable development in the Greater Wasatch Area.

A research group at BYU is also developing land-use and transportation planning software for the city of Provo. University research could assist Envision Utah in quantifying the impacts of alternative growth scenarios and selection of a preferred alternative.

Conclusion

Growth initiatives are prominent in both government and the private sector. They deal with a broad, yet interrelated, range of issues, from transportation and land use to water and air quality. The initiatives also focus on the national, statewide, regional, and local scales. Further collaboration among these initiatives will enhance the state's ability to address growth challenges. *

Transportation Funding

Overview

In 1997, a plan was adopted by the state to finance \$2.6 billion of construction projects above current levels of highway construction. One of the projects to be financed by this plan was the reconstruction of Interstate 15 (I-15) estimated at a cost of \$1.36 billion. After the plan was adopted and passed by the legislature, the Utah Department of Transportation (UDOT) received and accepted a bid from Wasatch Constructors for reconstruction of I-15 at a price tag of \$1.325 billion. However, with enhancements and changes in the program, the total cost of the I-15 project is now \$1.59 billion or \$230 million higher than the original estimate of \$1.36 billion. In a show of support for rural projects, the Governor, along with legislative leadership, decided to pay the additional \$230 million without decreasing funding for other projects. The state now must decide upon several funding alternatives to complete the projects.

Standard Transportation Program

The Utah Department of Transportation is in charge of the Statewide Transportation Improvement Program known as the STIP. This program includes highway and transit projects that are scheduled for construction in the next five years. The STIP contains a list of projects that have been approved by the Transportation Commission based on projections of various federal and state funding programs. A project that is needed but not currently funded in the five-year STIP plan is included on a list called "Unfunded Transportation Capacity Needs." The 1997 STIP Legislative Edition total for this list was over \$3 billion and included reconstruction of I-15 from 10800 South to 500 North. The major costs for Interstate 80 or I-15 north of 600 North were not included in this list. Before 1997, the STIP program typically funded approximately \$100 million of state projects each year. With the increasing population growth of Utah, the STIP program could not keep pace with needed projects and the list of unfunded needs was rapidly growing.

Centennial Highway Trust Fund

A trust fund entitled the "Centennial Highway Trust Fund" was created by the state legislature during the 1996 General Legislative Session. The purpose of the trust fund is to provide financing for the unfunded projects described in the previous section. Funds in this restricted account are to be used solely for the construction of critical transportation needs that previously were not scheduled for construction due to lack of financing. The planned funding sources for the Centennial Highway Trust Fund include General Fund monies; fuel taxes and registration fees; bonding; federal funds, local, private or toll road funding; and department efficiencies.

General Fund. The funding package for fiscal year 1998 includes an \$85 million General Fund appropriation growing by \$5 million annually through fiscal year 2003 and by \$10 million annually through fiscal year 2007. It also includes a \$30 million General Fund base adjustment through fiscal year 2007 growing annually at 6.0%, and a sales tax reduction of one eighth cent (\$34.25 million) through fiscal year 2007 also growing at 6.0%, see table. Total General Fund appropriations through fiscal year 2007 are estimated to be \$1.179 billion. In addition, beginning on January 1, 2001, the state's portion of the sales tax used for Olympic facilities will also go to the Centennial Highway Trust Fund.

Fuel Taxes and Vehicle Registration Fees. The legislature also approved a five cent per gallon motor fuels tax and shifted to the Transportation Fund a half cent per gallon tax formerly collected for the Underground Storage Tank program. Furthermore, the collection of diesel fuel was changed from the pumps to the distributor level and registration fees for vehicles and trucks were increased.

Bonding. Senate Bill 243, *Bonds For Highway Funding*, allowed the state to borrow up to \$600 million in general obligation bonds. The state currently has bonded for \$340 million and has commercial paper outstanding of \$260 million. The bonds sold with a very favorable interest rate and a bond premium of over \$11 million. Currently, the interest rate the state is earning on the unspent bond and commercial paper funds is greater than the interest rate owed on the borrowed money, thus creating arbitrage earnings. The state will spend the bond proceeds and commercial paper in less than two years, thus avoiding any federal arbitrage penalties.

Federal and Other Funding. The legislature also anticipated receiving \$50 million of federal aid and \$7 million in dedicated credits from local/private sources in fiscal year 1998. From fiscal year 1999 to fiscal year 2002, federal funding is estimated at \$400 million (\$100 million annually). Local, private or toll road funding is estimated at \$120 million for the next ten years.

Department Efficiencies. The legislature adopted department efficiencies of \$20 million per year through fiscal year 2007. For the most part, this is not a funding source but rather an offset to construction costs due to department efficiencies. As of yet, the definition of what constitutes a department efficiency has not been decided in the minds of legislators and is currently being debated. UDOT continues to emphasize that department efficiencies will mainly come from a reduction by a third or more in preliminary engineering costs and construction engineering costs thereby saving on total project costs.

Additional Costs of I-15 Reconstruction

The estimated costs of I-15 reconstruction increased \$230 million due to enhancements and changes in the program. These changes bring the total cost to nearly \$1.6 billion. These changes were presented by the Utah Department of Transportation to the Executive Appropriations Committee on April 22, 1997 and can be summarized as follows:

Changes in scope that affected the design/build bid proposal amount (millions of dollars):

\$(10.0)	Cooperative development of drainage facilities with local governments
30.4	Improved structure and pavement strength and durability/maintainability
76.5	Highway design refinements including aesthetics, lighting, etc.
22.5	Utility relocations (D/B contract costs)
(40.0)	Reduction due to owner controlled insurance program
50.7	Embankment stabilization and subsurface consolidation
13.0	Construction options (shorten viaducts, underpass at 10000 South, etc.)

Changes in the total program amount (millions of dollars):

\$20.0	Owner controlled insurance program
30.5	Payments for utility relocations, for railroad grad separation projects and for cooperative drainage development projects with local governments
(31.6)	Reductions (preliminary engineering costs incurred prior to Centennial Fund)
18.4	Program management, including design and construction oversight, contract administration, utility and railroad coordination, public information, right-of-way program implementation, etc.

Potential award fee (millions of dollars):

\$50.0	Total potential award (incentive) fee contractor can earn
--------	---

Total change in program costs (millions of dollars):
\$230.4

Problems and Alternatives

Problems. Three major problems exist with the current funding structure of the plan adopted by the legislature to fund projects in the Centennial Highway Trust Fund. First, the cost of the I-15 project increased by \$230 million. Before this additional cost was known, UDOT handed out a list of Centennial projects (projects financed from the Centennial Highway Trust Fund), that would be funded under the plan adopted by the legislature. Legislative leadership and the governor support the funding of other projects on this list.

The second problem is accelerated cash flows. The cash flow schedule submitted by Wasatch Constructors is greatly

accelerated over UDOT's original estimate of the cash flow schedule of I-15 costs. This is compounded by the additional costs of I-15 see Tables for details. Increased cash needs up front mean more money will be needed in the earlier years than was anticipated.

The third major problem is the unpredictable nature of several funding sources used to finance the original \$2.6 billion plan. These include additional federal funding, support from local or private sources, and toll road revenue.

Alternatives. If the amount to be received from all sources of projected revenue were known, the ability to plan for the future would be far less complicated. For example, additional federal aid that Utah may receive in the next six years is a major uncertainty. Congress failed to pass a new six year transportation plan before they recessed late in 1997. If a transportation bill had been passed, the state would have had a good indication of the amount of extra federal aid that may have been received due to reconstruction of high cost interstates, increased allocation to states, etc. According to UDOT, the earliest Congress may pass a transportation bill may be in April or May of 1998. Unfortunately this is well after the 1998 legislative session. The legislature will need to develop a new plan without knowledge of how much the state may receive from federal sources and when the funds will be available.

Assuming federal dollars will come in at the estimated amount of \$450 million, the financing plan will still need to be altered due to the increased costs of I-15 and the increased cash flow needs of Wasatch Constructors. The most likely alternatives are the following: 1) increase bonding or borrowing, 2) increase transportation related taxes or fees, 3) increase allocation of General Fund to transportation, 4) elimination other projects on the Centennial projects list, 5) delay the timing of some of the other projects on the Centennial projects list, or 6) a combination of the above.

If no additional financing is adopted in the next legislative session, there will not be enough financing in the current plan to meet Wasatch Constructor's cash flow needs and keep them on schedule. UDOT estimates that under the current funding plan, money to pay Wasatch Constructors will run out at the end of 1998. This may result in a breach of contract or significant penalties to the state. The state would have to delay many projects that are slated for construction in the next couple of years.

If the bonding amount were increased, projects could remain on schedule only if other sources of funding came through. If federal revenue projections fall short or if collections from the local, private or toll road sectors do not come in as anticipated, additional measures will have to be taken.

Assuming all funding sources come through, Table 90 shows the amount of bonding that would be needed to

accommodate the increased costs and increased cash flow needs of I-15. In comparison with Table 91, the amount of debt service has increased significantly and the amount of debt outstanding at the end of fiscal year 2007 is over \$350 million higher.

Conclusion

The governor and the legislature have some major decisions to make about financing for I-15 and other state projects on the Centennial projects list this year. Whatever plan changes are adopted, there is little doubt that additional decisions will have to be made in the future. Projected revenues and expenditures are fluid. Already, the timing of projects, cost estimates of projects, cash needs, estimates of revenues, bond interest rates, etc. have changed, some

significantly, since the inception of the funding plan. The revised funding plan submitted by the Fiscal Analyst to the Executive Appropriations Committee in June 1997 (see table 91) already contains outdated information.

This ten year plan, while addressing many of Utah's critical infrastructure needs, will by no means complete all transportation projects vital to Utah. Critical areas, such as the reconstruction of I-15 north of 500 North, and Interstate 80 from Parley's Canyon to downtown Salt Lake, are not included in full amount on the Centennial projects list. Responsible long-term planning necessitates a ten-year plan; however, the plan must be revisited each year for the upcoming ten years because of the changing environment. *

State Government Growth

An often discussed issue in Utah is that of the growth of government. Some see government's annual increases in spending as a sign that government is growing faster than can be afforded by taxpayers. Others look upon government growth as unnecessary, or worse, as a threat to freedom and prosperity. Is state government growing? If so, what is causing the growth? To answer these questions, Utah Foundation looked at state government growth from two perspectives.

The first method used to measure government growth was state expenditures per \$1,000 of Utah total personal income (TPI). The period studied was from fiscal years (FY) 1981 to 1998. The second method used to measure government growth was state government employment and wage trends as a percent of Utah's nonagricultural workforce and wages. The time series for this measurement was from 1980 to 1996.¹

Major Findings of 1997 Report

The major findings of the report are highlighted below, then follows a detailed discussion of each major point:

- ✱ State expenditures have stabilized relative to personal income over the last 10 years and, though there have been ups (1989, 1997) and downs (1988, 1990, and 1998), government has shown no overall growth relative to personal income. In other words, state government is projected to be no more burdensome on the Utah taxpayer in 1998 than it was in 1988.
- ✱ Medicaid expenditures continued to increase through 1996 but declined for the first time in 1997 and are projected to decline again in 1998.
- ✱ Law and order expenditures, one of the two main growth categories in the first study, continue to grow rapidly.
- ✱ After a long-term decline, a sharp increase in transportation infrastructure spending has occurred in the last two years. However, the five-cent motor fuel tax increase only partially funds the rise in transportation expenditures. Much of the enhanced spending on transportation infrastructure has come from general fund transfers and therefore, at the expense of general fund programs.
- ✱ State government employment and wage trends show no signs of increasing as a percent of total nonagricultural wage and employment trends. Rather, state government employment, (including higher education), as a percent of total nonagricultural employment, is at its lowest level of the entire study period.

¹ For the complete report see "A Look at State Government Growth", Utah Foundation *Research Report*, #609, October 1997.

Utah State Government Growth Appropriations as a Percent of Total Personal Income (1981-1998). For this report, actual state expenditures were used for fiscal years (FY) 1981 to 1996² and projected expenditures will be used for fiscal years 1997 and 1998.³

From FY 1981 through FY 1998, total state expenditures⁴ increased from \$1.5 billion to \$5.7 billion an increase of approximately \$4.2 billion. When measured per \$1,000 of TPI, state expenditures have risen from \$124.63 to \$130.88. State government is projected to spend \$6.25 more per \$1,000 of TPI in FY 1998 than it did in 1981.⁵ Operations expenditures⁶ grew slightly faster, from \$106.11 to \$113.41, an increase of \$7.30 per \$1,000 of TPI. Table 93 shows total state expenditures but divided into operations and non-operations (essentially capital and debt) per \$1,000 of TPI from 1981 to 1998. Figure 53 shows these numbers graphically. Of this total growth in state expenditures, almost all of it occurred during the first six years. In the last ten years, there has been virtually no growth in state expenditures, increasing by only \$0.44. Below is a brief discussion of the events that have influenced the changes in state expenditures.

The time series shows that from 1981 to 1982 state expenditures decreased. This was due mostly to necessary budget tightening because of a national recession. Then a

² The Governor's Office of Planning and Budget has developed a consistent time series for state government expenditures from FY 1981 to FY 1996. It is this time series that will be used throughout this section of the report for analyzing state government growth.

³ Utah Foundation has estimated FY 1998 expenditures. The legislature in its 1997 session authorized appropriations of \$5,565,519,350. However, actual expenditures are almost always more than the authorized amount for at least two reasons. First, supplemental appropriations are often authorized for various needs unknown at the time of the legislative session. Second, state agencies often receive federal dollars above what was initially estimated. Utah Foundation analyzed data from the Office of Planning and Budget and from the Office of the Legislative Fiscal Analyst, and has projected FY 1998 actual expenditures to be \$5,767,619,000 when FY 1998 ends on 30 June 1998.

⁴ All restricted and unrestricted funds from all sources as compiled by the Governor's Office of Planning and Budget.

⁵ Since our 1995 report, the Bureau of Economic Analysis has revised personal income numbers. As a result these revised numbers changed state expenditures per \$1,000 of personal income and therefore, are different from the first report.

⁶ The operations budget includes expenditures from all agencies and all programs except the capital budget and debt service.

sharp increase occurred in total expenditures over the next three years, while a similar increase occurred in operation expenditures over the next four years. There are two main reasons for this marked increase. First, the state experienced serious flooding problems during these years. Twenty-two of the state's 29 counties were declared federal disaster areas. Major parts of the state's infrastructure needed repairing. Interstate I-80 south of the Great Salt Lake was raised, the lake pumping project was initiated, and infrastructure damage from the Spanish Fork Canyon mud slide needed fixing. As a result, capital expenditures and debt increased from \$18.52 per \$1,000 of TPI in 1981 to \$29.54 in 1985.

Second, there was an increase in operations expenditures because of a significant rise in public education enrollments. Between 1983 and 1986, public education enrollments increased by more than 3% a year. This was substantially higher than in previous years. To address this growth, public education expenditures increased from \$46.47 per \$1,000 of TPI in 1981 to \$49.45 in 1986.

From 1985 to 1988, total expenditures decreased from \$143.02 to \$130.44. A significant decline in capital and debt expenditures caused this drop in expenditures. The main flooding problems had been addressed, thus allowing capital expenditures to be reduced by half, or from \$29.54 to \$14.33 per \$1,000 of TPI. In 1989, expenditures increased and then declined the next year. Changes in capital and debt service expenditures caused the rise and decline during this period. Expenditures fell by a little more than \$3 per \$1,000 of TPI in 1990. Again, the reason for the decline was the drop in capital expenditures.

From 1990 through 1994, state expenditures increased every year, rising from \$132.34 to \$134.08 per \$1,000 of TPI. Operations expenditures caused this increase, rising from \$115.97 to \$120.65. Of this increase, virtually all can be accounted for by the increase in Health Department expenditures. Non-operations expenditures actually declined from \$16.37 to \$13.43 per \$1,000 of TPI.

State expenditures declined slightly in 1995 and 1996 and then jumped in 1997. State government leaders had been in the habit of projecting revenues conservatively and with the strong economy, there had been a series of years with a surplus. Part of the surplus revenues funded property, sales, and income tax cuts of various amounts in fiscal years 1995 to 1997. Because of the perceived needs in some departments, state government officials chose to spend the balance of the surpluses. Much of this one-time money was used for funding ongoing programs in FY 1997, especially in public education. Some \$61 million in surplus funds were used in this manner.

In FY 1998 (starting on 1 July 1997) state expenditures are projected to decline to the lowest level since 1988. The main reason for this decline is a substantial decline in operations

expenditures. In fact, operations expenditures, which peaked in 1995, have fallen every year since. By contrast, non-operations expenditures, which had fallen in 1995 to their lowest level of the period have risen each year since.

The important point is that since 1988, state expenditures have shown no significant increase relative to personal income. Though there have been increases in some years and decreases in other years, the relative size of state government is unchanged. In 1988, state expenditures amounted to \$130.44 per \$1,000 of TPI; in 1998 state expenditures are projected to be \$130.88 per \$1,000 of TPI.

State Expenditures Consolidated into Major Areas. As important as it is to know if government is growing, it is equally important to know where the growth is occurring and what shifts in state expenditures are taking place. In order to understand this part of the story, a close look at state expenditures by department or groups of related departments is necessary. Without this more detailed understanding, a clear knowledge of what is happening and why, is impossible.

In order to put state expenditures into a simpler format for this analysis, several state departments have been combined. The major expenditure categories are: public education, higher education, other operations, transportation (operations and capital), capital and debt, law and order, and health (including environmental quality), Table 94. Expenditures per \$1,000 of total personal income (TPI) by major category are illustrated in Figure 54.

Public Education. From 1981 to 1988, public education expenditures (Figure 55) increased from \$46.47 to \$49.24 per \$1,000 of TPI. As already mentioned, the reason for this increase was a significant increase in school enrollment rates. Public education needed more money just to cover the additional costs of new students.

From 1988 to 1998, the story is different. Public education has lost ground, declining from \$49.24 to \$43.75. This is a reduction of \$5.49 per \$1,000 of TPI. The reason for this decline is moderating enrollment growth rates and increasing pressure to put resources into other state programs. During the 1980s, public school enrollments increased by an annual average rate of 2.6%. So far in the 1990s, the annual average rate of increase has been 1.2%. For most of the period, Medicaid and law and order demands received the bulk of any increases in expenditures. However, transportation infrastructure has received the greatest attention in the last two years. Demand for resources from these three entities was so great that public education declined relative to the overall size of state government. In FY1998, public education expenditures are projected to be the lowest of the entire period relative to personal income.

Higher Education. Higher education (Figure 56)

expenditures remained relatively stable from 1981 to 1991, declining slightly from \$16.65 to \$16.42 per \$1,000 of personal income. Since then, higher education has declined by \$1.78 per \$1,000 of personal income to a period low of \$14.64. Unlike public education, this decline in expenditures relative to personal income is occurring when the rate of enrollment growth has actually increased. In the 1980s, higher education enrollments increased by an annual average rate of 3.5%. In the 1990s, enrollments have increased by an annual average rate of 5.2%.

Some efficiencies may have been achieved by the majority of new higher education students enrolling in the less expensive community colleges of the state. During this period, almost 62% of all enrollments have occurred in the five community colleges -- most of those in Salt Lake Community College and Utah Valley State College. Students have also been required to pay more of the costs of their education as tuition and fees increase faster than inflation.

Other Operations. Other Operations consists of capital and debt expenditures, and all state departments except Health, Corrections, Courts, Public Safety, and Transportation.¹ Expenditures for these numerous departments and agencies remained quite stable from 1981 to 1995, declining from \$24.25 to \$23.65 per \$1,000 of personal income. Since 1995, other operations expenditures have declined in each year. The total decline through 1998 is projected to be \$2.19 per \$1,000 of TPI. The reason for the decrease in expenditures in these areas is the same as with the previous agencies discussed. The areas of health, law and order, and most recently transportation capital, are receiving not only all new monies but some of the funding that had been going to other programs (Figure 57).

Transportation. Transportation expenditures (both its operations budget and capital budget) as shown in Figure 58 declined from \$17.14 to \$12.57 between 1981 and 1995. This is a decline of \$4.57 per \$1,000 of TPI or 26.7%. This is the largest decline of any agency or groups of agencies. Such a decline created a serious backlog of highway needs. The backlog developed at both the state and local level of government because of the way the motor fuel tax is

¹ The main agencies included in this category are: Administrative Services, Agriculture, Alcohol Beverage Control, Commerce, Community and Economic Development, Employment Security, Financial Institutions, Human Resource Management, Human Services, Industrial Commission, Natural Resources, Public Service Commission, Retirement Board, Tax Commission, and all offices of elected officials. In 1997, the legislature created the Department of Workforce Services which incorporates the previous Department of Employment Security, and the offices of Family Support, Job Training, Child Care, and the Turning Point program. To be consistent with the our time series, FY 1998, in the report, does not show this change. In future reports it will.

distributed. Seventy-five percent of the tax revenue goes to the state and 25% to local governments.

Though more fuel efficient cars and declining federal participation are part of the funding problem, the major reason is that the motor fuel tax, unlike most other taxes, loses ground to inflation.² As a result, to increase motor fuel tax revenue, the legislature must raise the tax, not a popular thing to do. Prior to the motor fuel tax increase this year, the last time the legislature raised the motor fuel tax was 1987. As the state postponed raising the gas tax, the number of registered cars on the road increased by 27% and the number of vehicle miles traveled increased by 48%.

In the last three years, the legislature has turned the decline around and transportation expenditures have increased steadily to a projected \$15.46 per \$1,000 of TPI for 1998. However, this is still below the average expenditure of \$16.40 for the time period. In other words, the increase in transportation capital expenditures is not high by historic standards and is up sharply only when compared to the last several years of very low expenditures.

In the 1997 session, the legislature approved the borrowing of up to \$600 million for transportation construction bonds. The bonds were just recently issued. Though this raises the state's total general obligation bonded indebtedness from \$367 million to \$962.3 million, the bonds are a sound policy decision for three reasons. First, the amount needed to pay for the highway projects was more than the state could pay for on an on-going basis without significant tax increases. Second, interest rates are currently very low, especially for a state with a AAA bond rating. Third, by shifting some of the costs into the future, taxpayers who will benefit from the project will help pay for it.

Despite a motor fuel tax increase of five cents in the 1997 legislative session, much of the increase in expenditures for transportation has come at the expense of other state agencies. This is because motor fuel tax revenue is insufficient to cover the costs of the highway improvements. The additional revenue has come from bonds and transfers from the general fund. The governor proposed and the legislature created the Centennial Highway Fund in 1996 that has transferred \$188 million from the general fund to the transportation fund for highway projects in the last two fiscal years. These transfers are expected to continue. In

² The motor fuel tax is a unit tax, currently at 24.5 cents per gallon. As inflation increases, the value of the 24.5 cent tax decreases. For example, in 1987 the legislature raised the motor fuel tax to 19.5 cents. In 1997, the legislature would have had to raise the motor fuel tax to 27.5 cents just to keep the tax from losing ground to 10 years of inflation. Instead, the motor fuel tax was only raised to 24.5 cents. By comparison, the sales tax is an ad valorem tax and as a result it benefits from inflation because the sales tax is a percent of the value of the purchased product. As inflation increases, the revenue from the sales tax increases as well.

addition to the creation of the Centennial Highway Fund which reduces the general fund, the legislature has cut the property tax three times and the sales tax once in the last few years.

The use of bonding, the transfer of general fund monies to the transportation fund, and the tax cuts have resulted in a decline of state expenditures relative to personal income while more money is being spent on the state's highways. In the last three years, with a shift in expenditures to transportation, total state expenditures are projected to have declined by \$2.28 per \$1,000 of TPI. Stated differently, *the large increase in expenditures on transportation capital has come from the gas tax increase, bonding, and at the expense of General Fund programs, not at the overall expense of the Utah taxpayer.*

Capital (excluding Transportation), Debt, and Other Non-operations. Capital expenditures pay for the maintenance of existing state facilities and for new state buildings. Debt services are the payments on state bonds (general and revenue bonds). Almost all bond proceeds go for infrastructure projects. Over the 17 year period (see Figure 59), capital and debt have had significant fluctuations, bottoming at \$4.42 in 1992. Since then, capital and debt expenditures have increased to a projected \$6.38 per of \$1,000 TPI for 1998.

The \$600 million in bonds for transportation issued during the current year will increase debt service payments beginning with FY 1998. Clearly, bonding for I-15 reconstruction will impact state debt service payment significantly in the coming years.

Law and Order. Law and Order (Figure 60) consists of state courts and the departments of Corrections, Public Safety and the National Guard. The combined expenditures of these related agencies have increased from \$4.85 to \$8.59, an increase of \$3.74. Almost all of the increase can be accounted for by the Department of Corrections and the state courts. As mentioned, this category is the only one that has not seen a decline in expenditures to cover the shift in expenditures to transportation, capital and debt.

In 1981, Corrections expenditures amounted to \$1.68 per \$1,000 of personal income. In 1998, they are projected to be \$4.76. Corrections expenditures have almost tripled as a percent of total state expenditures from 1.3% to 3.6%. Utahns' concern over crime and state government's response to that concern are the main reasons for increases in corrections expenditures.

As with the entire nation, Utahns have become increasingly concerned over crime. The federal government and state governments across the country have responded to this rising concern by increasing incarcerations and mandating longer prison sentences.

This get-tough policy has had a profound effect on federal and state prison populations. In 1980, federal prisons held 20,611 inmates while all state prisons held 295,363 for a total prison population of 315,974. By 1994, the number of federal prisoners had increased to 79,795 and the number of state prisoners to 936,965 for a total prison population of 1,016,760. Total prison population in the United States has more than tripled in just 14 years.

In Utah the trends are similar.¹ *The average daily incarcerated population under the jurisdiction of the Department of Corrections has increased from 1,341 in 1982 to 4,272 in 1996. This is an annual average increase in the incarcerated population of 8.6%, more than four times as fast as the growth in the state's population! The incarceration rate² in Utah has increased from 77 per 100,000 population in 1982 to 182 per 100,000 population in 1996. However, it is not just the inmate population that is requiring more state resources. The state parole population has been increasing sharply as well. Between 1980 and 1996, the number of parolees has increased from 767 to 3,094, a 303% increase.*

Corrections is a labor intensive business. All convicted persons must be housed, supervised, fed, cared for medically, etc. After release they must be monitored by parole officers. As the population served by corrections increased, so did the need for corrections employees. Between 1985 and 1996, corrections employment has increased much faster than total state employment but has still not kept pace with the growth in the prison population.

Health and Medicaid. The most significant contributor to the overall growth in state expenditures is the Department of Health. As explained earlier, health expenditures (Figure 61) have increased from \$10.99 to \$20.60 per \$1,000 of TPI. No other state entity has had this kind of increase. It has not only increased substantially in relation to personal income but also as a percent of state expenditures. The Department of Health has grown more than any other state agency and is the main reason for the increase in state expenditures in relation to personal income. Even as significant as is the growth of this category, its expenditures declined in 1997 and are projected to decline in 1998.

The main reason for the growth in the Department of Health's budget is the Medicaid program which it

¹ The causes of the increase in law and order expenditures are discussed in detail in the previous report.

² The incarceration rate is the number of incarcerated persons per 100,000 population. Though Utah's 1996 rate of 182 per 100,000 population, is up dramatically, it is still well below both the national rate of 420 per 100,000 population and 373 per 100,000 population for the western states.

administers through the Division of Health Care Financing.¹

Medicaid expenditures as a percent of the state budget have gone from 6.1% in FY 1983 to 11.7% in FY 1998. The Medicaid budget has risen from 72.3% of the total Health Department budget in 1983 to 81.7% in FY 1998.

There are two main reasons for the rapid increase in Medicaid expenditures. First, medical inflation has substantially exceeded overall inflation in the United States. Second, the federal government has mandated several changes in eligibility requirements and new services since 1987. Some of the changes include expanded coverage of children under the age of six, pregnant women, the aged, blind, and disabled. As more people qualify for the coverage, overall costs are going to increase. The combined effect of higher than average inflation in medical care and an increasing number of participants has forced Medicaid expenditures to increase sharply.

To address this issue of rising health costs and other health care issues, Governor Michael Leavitt sponsored HealthPrint in 1995. This initiative is designed to expand health care coverage to Utah's uninsured, slow health care costs, and improve the quality and delivery of health care. The legislature has been supportive of the governor's proposals and several bills have been passed to address these concerns. Probably the most important change has been the controlling of health care costs by moving Medicaid clients into managed care programs and using the savings to expand Medicaid coverage to the uninsured.

Clearly, additional funding will be required if the third phase is going to be implemented. The question is where will it come from? The governor and legislature are hoping to cover this additional cost by the use of co-premiums for Medicaid clients and new federal matching funds. It seems unlikely that the state can accomplish this expansion, even with the use of the above options, without some additional state dollars.

Though HealthPrint is only three years old, some early signs are encouraging. Medicaid costs seem to have slowed and more Utahns are covered by Medicaid. Health Department expenditures declined in FY 1997 and are projected to decline again in FY 1998 from \$21.36 to \$20.60 per \$1,000 of TPI. If Medicaid expenditures are indeed leveling off, it is a significant turning point. However, most experts in the health care industry are not yet ready to be so optimistic. Nevertheless, medical costs have risen by an average annual rate of only 4.3% between 1992 and 1997 compared to an average annual rate of 7.5% in the previous 10 years. Given the goal of extending health care access to all uninsured Utahns, Medicaid may continue to be a growing portion of the budget.

¹ The Department of Health and the Medicaid program is discussed in more detail in the previous report.

Summary

These are the main points when looking at state expenditures relative to total personal income by major category:

- * Over the 17-year period under discussion state expenditures have increased by \$6.25 per \$1,000 of TPI. All of this increase occurred between 1981 and 1988 due to the historic flooding problems and a significant increase in public school enrollments.
- * Since 1988, there has been no real growth in state expenditures relative to personal income. In other words, state expenditures relative to personal income are projected to be no more burdensome on the Utah taxpayer in 1998 than they were in 1988.
- * Two categories – Health, and Law and Order grew a combined \$13.35. These two agencies have increased by more than the total growth of all state expenditures per \$1,000 of TPI. Stated differently, if Health and Law and Order are subtracted, state expenditures declined between 1981 and 1998 from \$108.79 to \$101.69 per \$1,000 of TPI. This is a reduction of \$7.10 per \$1,000 of personal income.
- * A major shift in state expenditures toward transportation and capital and debt service has occurred in the last three years. These major areas have increased by \$4.10 per \$1,000 of TPI.
- * This shift of funds from the general fund to transportation has occurred while total state expenditures have declined. In other words, the increase in transportation and capital and debt service has occurred not at the expense of taxpayers (for expenditures per \$1,000 of TPI have declined) but at the expense of other state programs. In the last three years every other major expenditure category has declined, relative to personal income, except law and order.

Utah State Government Growth -- Employment and Wages (1980-1996). The time series for the wage and employment analysis is 1980-1996. The data comes from the Department of Employment Security.

State Government. Between 1980-1996 state government employment has fluctuated very narrowly between 2.5% and 2.7% of Utah's nonagricultural workforce. In the last three years, state employment has fallen steadily and at 2.5% of total nonagricultural employment, is at its lowest level of the period. Utah State government wages have also moved within a narrow range over this period of time, ranging from 3.1% to 2.9%. State government wages were 2.9% of Utah's nonagricultural wage in 1980 and were the same in 1996.

Higher Education. Also part of state government, but tabulated separately, is higher education. Higher education employment has shown virtually no change during the time of study. It stood at 3.2% of employment in 1980 and in 1993. Since then, higher education employment has fallen

three years in a row and in 1996 stood at 2.9%. Higher education wages, also show virtually no change, fluctuating from 2.6% to 2.8% of total Utah wages.

Combined, state government and higher education employment has ranged from 5.4 to 6.0% of Utah's nonagricultural workforce between 1980-96. Currently at 5.4%, combined state government and higher education employment is at its lowest level of the entire study period. Wages have also moved within a narrow range—5.5% to 5.9% of total nonagricultural wages. In 1996, state government and higher education wages amounted to 5.7% of total nonagricultural wages. Utah's strong economy, which is being driven mainly by the private sector, has pushed private sector employment and wages to historic highs. Private sector employment now constitutes 82.6% of total nonagricultural employment, not only the highest during our period of study but the highest since World War II. Likewise, private sector wages, are also at their highest point at 80.1% of total wages. *In summary, state government wages and employment are not increasing as a percent of either Utah's total wages or the state's nonagricultural workforce. Rather, state employment (including higher education) has fallen as a percent of the nonagricultural workforce for the last four years.*

Conclusion

Is state government growing? The answer is: it was growing. Between 1981 and 1998, total state expenditures, per \$1,000 of TPI grew from \$124.84 to \$130.88, an increase of \$6.25 or 4.8%. However, all of that increase occurred between 1981 and 1988. During this period there were some important and unique reasons for the growth, such as major flooding problems requiring major investment in infrastructure, and rapidly rising public education enrollments.

Since 1988, state expenditures have stabilized and have shown no overall increase. Though the last 10 years have shown no real growth in state government expenditures, there have been profound shifts within the state budget.

The Department of Health, which administers the Medicaid program, has shown the largest increase in expenditures. In 1997, Medicaid expenditures slowed and decreased slightly relative to total personal income. They are projected to decline again in 1998. Whether this is a turnaround or a temporary respite is yet to be determined. Governor Leavitt's HealthPrint is trying to address health care costs.

But the goal of HealthPrint is not only to keep costs down but to provide access to basic health care for all Utahns. The federal government is giving states more flexibility than ever before in managing Medicaid in hopes that solutions can be found in slowing the costs of this program.

Though a smaller part of state government, law and order expenditures have shown substantial growth and, unlike health, show no signs of slowing down. Department directors, the governor and legislative leaders, are concerned about the increased amount of state dollars going to administer these programs. Those involved in corrections are looking at home confinement, fines and other options to incarceration for all but the violent criminals. But these ideas only nibble at the edges. As long as society demands that government get "tough on crime," corrections expenditures are going to grow.

One of the important trends over the last three years is the increase in expenditures on roads, particularly I-15 reconstruction. Greater resources for transportation infrastructure were clearly needed and the shift will be a significant step forward in addressing the state's transportation needs.

With the exception of expenditures for Medicaid, law and order, and the sharp increase in transportation capital expenditures in the last few years, other areas of state government have shown no growth relative to total personal income over the past 17 years. In fact, the last three years show that the increase in transportation capital has come, not at the expense of the Utah taxpayer, but at the expense of general fund programs.

Such a shift keeps the tax burden from increasing, but it places increasing pressure on the programs which are being affected by the shift. Public and higher education, which are arguably a key to Utah's future, are receiving the lowest level of funding, relative to total state personal income, of any time during the past 17 years.

The challenge for Utah's governor and legislature is to find that delicate balance between providing adequate resources for all state programs, while keeping Utah's tax burden within acceptable levels. This is no easy task given Utah's unique demographics and fast-growing population. Great care and a visionary perspective of Utah's future will be needed to successfully deal with this delicate balance. *
