Utah Economic and Business Review

Bureau of Economic and Business Research David Eccles School of Business University of Utah

September/October 2004 Volume 64 Numbers 9&10

Highlights

- The \$14.4 billion (constant 2004 dollars) of transportation infrastructure investments planned for the Wasatch Front over the next three decades will significantly influence the region's economic development potential, relative competitiveness, and land use patterns.
- This new capacity construction spending will average \$531.6 million per year over the 27-year period and includes average annual spending of \$163.4 million by UTA (transit), \$226.9 million by WFRC (highways), and \$141.3 million by MAG (highways).
- The federally financed share of these projects increases the size and composition of the regional economy. Federal in-state spending on these construction projects is estimated to total \$4.2 billion over the 27-year period. This is an annual average of \$155.7 million composed of \$45.3 million for UTA, \$68.1 million for WFRC, and \$42.4 for MAG.
- The impacts of this federal spending have been analyzed with the REMI model. These federal dollars result in an average annual employment impact of 2,800 additional jobs. This incremental employment will support about 3,900 more people for the duration of the projects than would have been the case without the federal spending. The state's economy, as measured by Gross State Product (GSP), will, on average, be larger by \$211.8 million per year. Personal income will be larger by an average of \$197.0 million annually, as compared to what it would have been in the absence of the federal spending. Incremental state income taxes will increase on average by an estimated \$5.9 million on an annual basis.
- The total economic activity (both externally and internally financed) associated with the 27-year construction program is an annual average of about 8,500 jobs, including approximately 3,400 in construction, the majority of which are in the heavy construction sector. The associated impact population averages about 11,600 annually. Average annual personal income associated with the construction projects is \$640.4 million while the average annual GSP associated with this economic activity is \$639.9 million. State income taxes generated by this economic activity are on average \$19.2 million annually.

Economic and Demographic Impacts of Federally Financed Transportation Infrastructure on the Wasatch Front

Pamela S. Perlich, Senior Research Economist

Over the next three decades, \$14.4 billion (constant 2004 dollars) of new transit and highway infrastructure is planned to meet the transportation needs of the Wasatch Front.¹ These investments will significantly influence the region's economic development potential, relative competitiveness, and land use patterns. While these more comprehensive long-term effects of the transportation improvements are justifiably the primary focus of planners, there are also substantial regional economic benefits derived from the construction activity. These heavy construction projects employ a labor force that is specialized in the design and construction of transit and highways and that is paid higher than average wages. Given the nearly 30-year duration of these projects, the development of this sector could ultimately result in a regional specialization and eventual export of these services to other regions. This analysis identifies and analyzes the economic and demographic impacts of the construction of transportation infrastructure along the Wasatch Front from 2004 through 2030, particularly focusing on the federally financed portion. The Utah Transit Authority (UTA) has sponsored this research.

Magnitude of the Total Project Spending

The combined population of the Wasatch Front counties (Davis, Salt Lake, Utah, and Weber) is projected to grow by just over 1 million by 2030, increasing from an estimated 1.8 million in 2003 to 2.8 million. The Mountainland Association of Governments (MAG) and the Wasatch Front Regional Council (WFRC) have collaborated with the Utah Transit Authority (UTA), the Utah Department of Transportation (UDOT), and the local governments in their jurisdictions to prepare long-range transportation plans (LTP) to accommodate the transportation needs of the growing metropolitan Wasatch Front. These long-range transportation plans include nearly \$10 billion of highway and major arterial construction and \$4.4 billion in transit projects in the four-county area. The construction spending will average \$531.6 million per year over the 27-year period. The UTA plans to

establish bus rapid transit service and to build heavy and light rail at an annual rate of \$163.4 million. WFRC plans for an average annual \$226.9 million or a total of \$6.1 billion in highway expansion. The MAG LTP calls for \$3.8 billion to expand highway capacity by 2030; this is an annual average of \$141.3 million. (Table 1 and Figure 1) All of these expenditures, which have been incorporated into the official long-term transportation plans, increase capacity and do not

include operations and maintenance. New capacity projects include construction and expansion of highways, freeways, and major arterials along the Wasatch Front. New capacity transit projects include bus rapid transit, light rail, and commuter (heavy) rail in the same area.²

Projects Included in the Transit Investment Plan

The 2030 long range plan for transit includes commuter rail, light rail lines, bus rapid transit (BRT), and transit ways. These transportation improvements are designed to function as a system and will eventually include a network of signaling devices, park-and-ride lots, transit hubs, and intermodal centers. Commuter rail will extend from Weber County to Utah County. Light rail extensions are planned for Mid Jordan, West Valley, Airport, Draper, 3500 South, Draper/Traverse Ridge, and Sugarhouse. Bus rapid transit expansions include Provo/Orem. South Davis. North Davis. Redwood Road, Fort Union Boulevard, and Washington Boulevard. Transit corridors are planned for the Mountain View Corridor, Weber State University Transit Way, and Foothill Drive/I-215 Enhanced Bus.

Projects Included in the Highway Investment Plan

The long run transportation plans of MAG and WFRC identify capacity expansion for highways and major arterials. In Utah County, MAG has proposed major improvements in the I-15 corridor, including lane additions and interchange additions and reconstructions. Three major east-to-west corridors are planned to improve accessibility to the rapidly growing northwest area of the county. The Western Transportation Corridor (from Lehi to Pleasant Grove) and many expansions to major arterials are also included in the LTP.³ The highway capacity expansion projects included in

the 2030 LTP update of WFRC include two new freeways – the Legacy Parkway and the Mountain View Corridor – and capacity expansion of I-15, the 2100 South Freeway, and I-80. The WFRC plans to add or widen major arterials in Weber, Davis, and Salt Lake counties.

Economic Impacts of Investment in Transit and Highways

Transit and highway investments produce a wide range of economic impacts. A framework for classifying these impacts has been developed by Cambridge Systematics in research sponsored by the Transportation Research Board. They identify three types of economic impacts — Generative, Redistributive, and Financial Transfer Impacts.

Generative Impacts contribute to the economic growth of a region by improving the performance of the regional transportation system. These may include reduced travel times, increased accessibility, and improvements to air quality and safety. Transit investments can also reduce the demand for parking, improve access to employment centers, and consequently raise regional productivity by lowering infrastructure costs. These Generative Impacts create employment and income over and above the economic activity generated by the construction, operation or maintenance of the transportation system. This augmentation to regional economic growth occurs regardless of the funding sources used for the construction.⁴

Redistributive Impacts rearrange economic activity within a region as additional transportation infrastructure alters relative intraregional transportation costs. Employment and development tend to cluster near transportation hubs and corridors. Transportation costs also significantly influence residential type and location choices. Importantly, these Redistributive Impacts do not produce net new employment or income in the regional economy, but do significantly alter the spatial distribution and land use patterns. These impacts are also dependent upon local zoning ordinances.

Financial Transfer Impacts occur when funding for transportation projects originates from outside the region. Traditional economic impact analyses measure Financial Transfer Impacts. Like Generative Impacts, Financial Transfer Impacts result in an increase in the size of the regional economy. Traditional economic

Figure 2

Shares of Transportation Infrastructure

Spending Financed by the Federal Government: 2004-2030

impact analyses estimate the net new economic activity that is generated by regional exports or by economic activity funded from external sources. Only Financial Transfer Impacts (i.e., traditional economic impacts) of project construction are measured in this analysis. Externally financed transportation system operations and maintenance are not included in this analysis. According to this methodological approach, the portion of transportation infrastructure funded by the federal government increases the size of the regional economy, while the internally financed portion redistributes economic activity within the region, but does not increase its size. Importantly, the Generative Impacts and Redistributive Impacts have not been considered in this study.⁵

Federal Spending in Utah on Transportation Projects

Funding sources for the \$14.4 billion of the recommended new transit and highway construction have not yet been identified. Given the current funding structure, it has been estimated that over two-thirds is unfunded and that the Wasatch Front is confronting a "transportation funding crisis."⁶ At present, transportation planners anticipate that the federal share of transit projects will be 35 percent while the federal

contribution to future highway projects will be 30 percent. Federal contributions to transit and highway projects vary from year to year and are subject to a range of factors. There is no guarantee that federal funding will reach the levels implied by these assumed contribution shares. In the UDOT LTP, federal funds for highway construction are assumed to grow at a rate of 2 percent annually. In 2003, these federal contributions for construction were \$211 million.7 To the extent that spending for highway construction grows faster than this rate, the internally financed portion of the projects increases relative to the federal share.8

The federally financed portion of these planned transportation improvement projects is an infusion of new money into the Wasatch Front and it increases the size of the state's economy. The internally financed portion of the projects initially alters the structure but not the size of the regional economy, if only the Financial Transfer Impacts are evaluated. For this study, the assumed federal contribution to highway projects is 30 percent and while the federal share of transit projects is assumed to be 35 percent, which is consistent with the long-term plans. To the extent that these funding assumptions underestimate the flow of federal funds to Utah for transportation system improvements, this study underestimates the associated economic and demographic impacts. Conversely, if the federal contribution is lower than assumed here, the results overstate the economic and demographic impacts of the construction projects. (Figure 2)

Although the federal share of transit projects is higher than that for highways, a larger portion of the purchases of materials and equipment to construct transit will be made out-ofstate. For example, the rolling stock and specialized signaling equipment must be purchased from outside Utah, while more of the required inputs for highway construction (cement, aggregates, etc.) are available in-state. Purchases from out-of-state are imports that constitute leakages from the economy and reduce the economic impact of project spending. After accounting for these spending patterns, the estimated amount of federal purchases in Utah for both transit and highway projects average \$155.7 million annually for a

total of \$4.2 billion by 2030. Of these, \$1.2 billion are devoted to transit improvements while \$3.0 billion are for highway improvements.⁹ (Table 2 and Figures 3-6)

 Estimated In-State Federal Spending on Transportation Infrastructure Projects

 Millions of Constant 2004 Dollars

Source: BEBR analysis of MAG, UTA, and WFRC data.

Economic and Demographic Impacts of Federal Spending

According to traditional regional economic approaches, economic impacts occur when production within a region is externally financed or purchased. The federal dollars financing transportation construction directly employ Utah residents and are used to purchase other inputs for the construction; a portion of these purchases will be from Utah firms. These Utah workers and firms make purchases that have further multiplier effects in the state. In addition to these strictly defined economic impacts, the additional economic activity resulting from the 27-year construction program enables more people to live in Utah. This includes the workers themselves and others in their households. The REMI model has been used to capture these dynamic impacts.¹⁰

Over the course of the 27-year construction program, the employment impact of the federally financed portion of the projects is an annual average of about 2,800 additional jobs. This incremental employment will support about 3,900 more people for the duration of the projects than would have been the case without the federal spending. The state's economy, as measured by Gross State Product (GSP), will, on average, be larger by \$211.8 million per year.¹¹ Personal income will be higher by an average of \$197.0 million annually, as compared to what it would have been in the absence of the federal spending. Incremental state income taxes will increase on average by an estimated \$5.9 million on an annual basis. (Table 3 and Figure 7)

Besides the heavy construction sector, economic activity and employment will be created in services (especially engineering and management services), manufacturing,

trade, and state and local government. The households directly employed by the projects will purchase goods and services in the community to support retail, service, government, and other sectors. All of this increased employment contributes to a higher level of personal

> income than otherwise would have occurred if the federal dollars had not been spent in the state. (Table 4 and Figure 8)

These additional economic opportunities result in more people being able to live in the region than would have been the case without the projects. This "impact population," which increases over time as household sizes grow through child bearing, may be new residents migrating to the area or current residents who are not forced to leave the area for employment elsewhere. This could represent additions to net in-migration to the Wasatch Front or less net outmigration from the region, depending upon future labor market conditions. Short-term heavy construction projects

often bring large contingents of temporary workers who send the bulk of their paychecks to households outside the region. Because the projects in the Wasatch Front long-term transportation plan span several decades, the majority of the labor force should be permanent residents of Utah. (Table 5 and Figure 9)

Economic Activity of Total Project Expenditures

Although the internally financed portion of the \$14.4 billion transit and highway investment does not increase the size of the regional economy, when measured with traditional economic impact methods, it

does alter its structure. As previously discussed, Generative Impacts capture the economic benefits of investment in transit and highways, even if internally funded. The total economic activity associated with the 27-year construction project is an annual average of about 8,500 jobs, including approximately 3,400 in construction, the majority of which are in the heavy construction sector. The associated impact population averages about 11,600 annually. GSP associated with the total in-state construction spending is on average \$639.9 million per year while personal income associated with total economic activity is \$640.4 million annually. State income tax generated by total economic activity of the construction of this infrastructure is estimated to be about \$19.2 million on an annual average basis.¹² (Tables 6 and 7, Figures 10 and 11)

Direct Project Employment

Heavy and highway construction employment in Utah has been on a general upward trend since 1970, although the sector has been subject to the volatility of major project starts and completions. (Figure 12) Depending upon the exact timing of the construction generated by the longterm transportation plan, this 27-year heavy construction program could introduce an element of stability and growth to this sector.

In 2002, the average monthly wage for the construction sector in Utah was \$3,467, which is 38 percent higher than the \$2,510 average wage for all jobs in the state. The average monthly wage for highway, street, and bridge construction (a sub-sector of heavy construction) was \$3,560. The architectural and engineering services

sector, which is a major support sector to transit and highway construction, had an average monthly wage of \$3,831 in Utah in 2002.¹³ Jobs generated by heavy construction projects are on average higher skill and pay than the average for all sectors. (Figures 13 and 14)

Note: TCPU is Transportation, Communication, and Public Utilities. FIRE is Finance, Insurance and Real Estate. Source: BEBR analysis using the REMI model.

Economic growth supports a larger population and certainly this induced population growth imposes fiscal burdens on state and local governments. However, when wages associated with the direct project employment exceed the state average by such a substantial amount, as is the case with heavy construction projects, the tax revenues per direct job also exceed the average.

Conclusion

The \$14.4 billion of planned transit and highway infrastructure for the Wasatch Front occurring from 2004

through 2030 will contribute significantly to the economic growth and development of the region. These investments will have a wide range of economic, fiscal, demographic, and environmental impacts. This study has focused on the strictly defined economic and demographic impacts associated with the construction projects themselves, a subset of the larger impacts. Although other comprehensive impacts the will shape the future of the region more permanently, the construction projects themselves create and sustain a specialized heavy construction sector with average wages that are over a third higher than the average for the state as a whole. There is also the potential that such a long-term transportation investment program will sustain a specialized labor force with expertise that could ultimately provide services to other regions.

Endnotes

¹All dollars in this report are 2004 constant dollars unless otherwise noted. Wasatch Front refers to Davis, Salt Lake, Utah, and Weber counties combined.

²The WFRC has published *Wasatch Front Urban Area Long Range Transportation Plan Update: 2004-2030* (December, 2003). MAG is in the process of updating

their plan, and some of their data was provided in draft form. Their most recent plan is 30 Year Long Range Transportation Plan. The project list in this LTP was amended for this study. The Utah Transit Authority provided a detailed listing of transit investment projects. UDOT has produced Utah Transportation 2030: State of Utah Long Range Transportation Plan (January 2004). These plans allocate projects to different multi-year phases. BEBR developed algorithms in consultation with the UTA, MAG, and WFRC to convert these to projected annual spending patterns. Details of these calculations are available on request.

³For this study, two illustrative projects were added to the third phase.

⁴Cambridge Systematics is completing work for Envision Utah to estimate the Generative Impacts of the transit component of the 2030 long run transportation plan.

⁸The federal share of total project costs for the Salt Lake North/South Light Rail Line was 77 percent, for the University Light Rail Line it was 81 percent, and for the Medical Center Light Rail Line it was 60 percent. These data were provided by UTA.

⁹In this analysis, the estimated annual federal spending on transportation construction was smoothed to generate a more realistic pattern of annual project spending. This smoothed series was then constrained to phase spending totals for each entity. These gross flows were allocated to economic sectors representing project spending in Utah. These were then translated into inputs for the REMI model.

¹⁰Regional Economic Models, Inc. has built *Policy Insight* models for the State of Utah. The 57-sector state model has been used in this study. The model is a structural equation dynamic projection model. Detailed information on the modeling techniques used in this analysis is available upon request.

¹¹Gross State Product is a measure of the value added

Figure 14 Utah Average Monthly Wages: 2002

Source: Dept. of Workforce Services, 2003 Annual Labor Market Report

production of a state. It is the state counterpart of the Gross Domestic Product at the national level. It is the value of gross output minus the value of intermediate inputs (imports).

¹²These estimates of income tax collections have been developed by BEBR. A four-year average of the ratio of income taxes to personal income for Utah have been

> applied to the personal income projections generated by REMI. The tax data are for fiscal years 1998-99 through 2000-01 as reported by the U.S. Bureau of the Census in *Government Finances.* Calendar year personal income estimates from the U.S. Bureau of Economic Analysis have been converted to a fiscal year basis for the computations.
