

## Utah's Energy Industry

*By: Michael Vanden Berg, Energy and Mineral Program Manager, Utah Geological Survey*

Heading into 2022, energy experts debated the speed and timing of a return to “normal” energy demand following a tumultuous 2020–2021 as the world responded to the COVID-19 pandemic. As vaccines became widely available in the first half of 2021, optimism grew in the energy economy as demand quickly headed back to pre-pandemic levels. In many cases, energy demand increased faster than supply, causing significant run-ups in prices, as well as supply chain constraints. These problems were compounded when Russia invaded Ukraine causing more disruption to energy supplies. Overall, the higher energy prices and the greater demand spurred increases in local drilling and production of oil and natural gas. In addition, the federal administration maintains an emphasis on a transition to carbon-neutral energy sources, most acutely seen in the electric utility sector with a continued shift away from coal to more renewable sources.

Utah crude oil prices peaked near \$100 per barrel in summer 2022 before dropping back to about \$65 per barrel in the fall, and averaged \$81.50 per barrel for the year—the highest price since 2013 and more than double the average price in 2020. This rebound in price, coupled with record-high petroleum demand, resulted in a 26% increase in Utah crude oil production to 44.6 million barrels in 2022, the highest annual production on record. Natural gas prices more than tripled since 2020 to \$7.00 per thousand cubic feet (Mcf) in 2022 and resulted in an annual natural gas production increase for the first time in nearly 10 years, reaching 260 billion cubic feet (Bcf) in 2022.

Construction of new utility-scale solar facilities continued in 2021 and 2022 with the addition of about 650 megawatts (MW) of capacity, bringing Utah's total solar capacity to 1.5 gigawatts (GW). Solar dominates Utah's renewable energy portfolio, providing 65% of total renewable capacity. In the residential sector, total installed residential photovoltaic (PV) capacity in Utah has increased from just 6 MW in 2013 to about 356 MW in 2021.

Utah coal production dropped to the lowest level in nearly 40 years, just 11 million tons in 2022, despite a significant increase in coal prices. The establishment of a foreign export coal market continues to be a challenge as access to West Coast ports remains in question. Electricity generation in Utah decreased

8% in 2022, despite consumption increasing to a new record high of 33,100 GWh. Electricity prices also increased but continue to be nearly 30% lower than the national average.

Demand for oil and natural gas remained strong in 2022 and will continue to play a major role in Utah's energy landscape. However, there is a noticeable shift at the federal level to move more quickly to carbon-neutral energy sources. Fortunately, Utah is well positioned to take the lead in this energy transition with major research projects focused on geothermal energy, hydrogen technology, carbon sequestration opportunities, and utility-scale storage, as well as the continued buildout of large-scale PV solar farms, which soon could be coupled with innovative battery storage.

### 2022 SUMMARY

#### Petroleum

**Production.** Utah oil production took a major hit in 2020, dropping to 31.0 million barrels, when the COVID-19 pandemic caused major global disruptions to petroleum prices and demand. Production bottomed out at 69,600 barrels per day in May 2020, but then steadily increased and then surpassed pre-pandemic levels in 2021 and 2022, hitting a record high of 136,500 barrels per day in October 2022 (before dropping slightly in November to 122,700 barrels per day, the most recent data at time of writing). Total crude oil production for 2022 is expected to reach a record high of 44.6 million barrels, a 26% increase from 2021 (44% higher than 2020), mostly attributable to the drilling of very successful long-reach (10,000+ feet) horizontal wells in the Uinta Basin. Total crude oil pipeline imports from Colorado, Wyoming, and Canada increased a modest 2.6% to 38.8 million barrels in 2022 as refineries continued to adjust to post-COVID-19 increases in petroleum product demand. Similarly, refinery receipts—the amount of crude oil delivered to Utah's five refineries—increased 6.5% to a new record high of 71.1 million barrels. With the growth in production in 2022, estimated exports of Utah crude oil nearly doubled to 12.3 million barrels, mostly related to more Uinta Basin crude oil heading to the Gulf Coast via trains that are loaded near Price, Utah.

**Prices and Value.** After a volatile year in 2020, oil prices increased steadily in 2021 and the first half of 2022 as petroleum demand returned to pre-pandemic levels. Utah oil prices started the year near \$70 per barrel but steadily increased to about \$100 per barrel by mid-summer, before falling again back to about \$65 per barrel in December. The overall average 2022 crude oil price in Utah is estimated at \$81.50 per barrel, up 34% from the 2021 price and up 133% from the 2020 price. The increase in price, coupled with a resultant surge in production, pushed the value of Utah's produced crude oil up to \$3.6 billion in 2022, a new record high in nominal dollars and more than triple the 2020 value. Following suit, Utah's average price for regular unleaded motor gasoline and diesel also significantly increased in 2022 to \$4.23 and \$4.97 per gallon, respectively.

**Consumption.** Petroleum product demand plummeted in 2020 as travel restrictions and stay-at-home directives went into effect due to the COVID-19 pandemic, but demand quickly rebounded, surpassing pre-pandemic levels in 2021 and again in 2022. Utah's refined petroleum product production reached a record high of 82.8 million barrels in 2022, a 6.2% increase from 2021. Refined petroleum product imports from Wyoming via the Pioneer pipeline also increased by 3.9% in 2022, and Utah refineries export an estimated 30 to 35 million barrels of petroleum products per year via pipeline to other states. Utah's total petroleum product consumption is expected to reach a new record high in 2022 at about 64 million barrels, 6% higher than 2021 and 16% higher than the COVID-19-influenced drop in demand in 2020. Nearly 48% of total petroleum demand was motor gasoline, and diesel represented 28%. Utah imports and exports significant amounts of petroleum products, but overall, Utah is a net exporter, only using about 80% of the product refined at Utah-based refineries (but is dependent on out-of-state crude oil imports to make refined products).

## Natural Gas

**Production.** Utah's natural gas production peaked in 2012 at 491 Bcf but then retreated to 240 Bcf by 2021 due to several years of low prices and a lack of natural gas drilling in Utah. However, production rebounded 8% in 2022 to about 260 Bcf as prices spiked and natural gas-specific drilling resumed for the first time in nearly four years. Natural gas production was also boosted by the significant associated gas produced from new crude oil wells. Dry natural gas production and natural gas sales in 2022 also increased to 250 and 215 Bcf, respectively, and natural gas liquids production increased to 3.7 million barrels.

**Prices and Value.** After averaging only about \$2.50 per Mcf between 2015 and 2020, the wellhead price for natural gas in Utah increased to \$4.11 in 2021 and then again to \$7.00 in 2022. Natural gas prices near \$2.50 per Mcf provided little economic justification for natural gas exploration or development. However, with the dramatic increase in prices over the past year, natural gas-specific drilling has resumed (four rigs were drilling natural gas wells in late 2022). When wellhead prices increase, so do consumer prices; the residential natural gas price increased about 20% in 2022 to \$10.75 per Mcf and the price for industrial uses increased 43% to \$7.74. Higher natural gas and natural gas liquids production, coupled with higher prices, pushed the 2022 natural gas production value to \$2.0 billion, 82% higher than 2021 and nearly quadruple the value recorded in 2020.

**Consumption.** Natural gas consumption in Utah has been volatile over the past several years mostly due to large swings in the electric utility and residential markets. Consumption in Utah is expected to reach a record high in 2022 of 271 Bcf, about 4% higher than 2021. Most natural gas in Utah is used for residential purposes (28%) or electricity generation (29%), followed by the commercial (17%) and industrial (14%) sectors. Traditionally Utah has been a net exporter of natural gas, but this changed starting in 2020; for the past three years Utah has been a net importer.

## Coal

**Production.** In 2022, Utah had six active coal mines, the fewest number since mining operations began in Utah nearly 150 years ago. This number was recently reduced to five when the Lila Canyon mine was temporarily idled due to an underground combustion event, and it is currently unclear when (or if) the mine will be able to resume production. Overall, coal production dropped by 12% in 2022 to 11.0 million short tons, well below the 24.5 million tons averaged in the 2000s. The decline in Utah coal production started during the 2008 recession, but demand never rebounded like other energy commodities since coal has dropped out of favor as a fuel for electric and industrial needs. Production at the two remaining Wolverine mines, Skyline and Sufco, accounted for 61% (6.7 million tons) of Utah's total coal production. The Emery County Coal Resources Lila Canyon mine produced 2.3 million tons of coal before being idled in September. In mid-2020, COP Coal Development bought the Castle Valley mines, now called Gentry, from Rhino Resources and produced about 500,000 tons in 2021 and 600,000 tons in 2022. The Coal Hollow mine in southern Utah produced about 350,000 tons in 2022 from their surface mine, including new production on their long-sought federal coal leases. Bronco Energy's Emery mine produced about 1.1 million tons of coal in 2022, about the same as in 2021.

**Prices and Value.** The average mine-mouth price for Utah coal dramatically increased to about \$45 per short ton in 2022, a relatively high price in nominal dollars but still well below the inflation-adjusted high of \$118 per ton reached in 1976. The end-use price of coal at Utah electric utilities, which includes transportation costs, also increased to \$47 per ton in 2022. The value of coal produced in Utah totaled \$494 million in 2022, 3% higher than 2021, but well below the inflation-adjusted high of \$1.5 billion recorded in 1982.

**Consumption.** Demand for coal in Utah dropped 17% between 2015 and 2016, then remained steady (about 12.6 million tons) until 2020 when it dropped to about 11 million tons in response to the pandemic-related decline in electricity demand. Demand rebounded in 2021 back to 12.6 million short tons, but decreased again in 2022 to 11.6 million tons, 97% of which was burned at electric utilities. Coal demand in Utah's industrial sector, mostly by cement and lime producers, dropped to about 340,000 tons in 2022, a quarter of peak demand of 1.4 million tons reached in 2005. Utah used to be a significant net exporter of coal to neighboring states, but out-of-state domestic demand dropped from a high of 16 million tons in 2001 to just 1.6 million tons in 2022. Utah's foreign coal exports peaked in the mid-1990s at about 5 million tons, then dropped to near zero in the mid-2000s. Demand from the foreign market has increased over the past decade, totaling an estimated 2.7 million tons in 2022; however, West Coast port access for overseas transport remains a challenge.

## Electricity and Renewable Resources

**Production.** Electricity generation in Utah decreased 8% in 2022 to 39,265 gigawatt hours (GWh) after rebounding in 2021 (42,566 GWh) from a nearly 20-year low in 2002 (37,087 GWh). Coal-fired electric generation once dominated Utah's electric portfolio, providing 94% of electric generation back in 2005. In 2022, coal accounted for only 57% of Utah's electric generation. Increases in natural gas generation (28% in 2022) and renewable sources (15% in 2022) have broadened Utah's generation portfolio. The largest change in Utah's electricity sector is the recent exponential increase in utility-scale PV solar capacity. Between mid-2015 and the end of 2016, 855 MW of utility-scale solar capacity came online, more than wind, hydroelectric, geothermal, and biomass combined. Between late 2019 and the end of 2022, an additional 680 MW of solar was installed for a total of 1.5 GW of utility-scale solar capacity. With these new additions, solar contributed just under 10% of Utah's total electric generation in 2022. In contrast, electric generation at Utah's coal-fired power plants has decreased over 41% since 2008.

**Prices.** The overall price of electricity in Utah has remained mostly steady over the past ten years, but with a slight uptick (7%) in 2022. Utah's 2022 average electric rate of 8.9 cents per kilowatt-hour (kWh) for all sectors of the economy is about 30% lower than the national average of 12.5 cents. This lower rate is mostly attributed to Utah's established fleet of coal-fired power plants, which still supply 57% of electricity generation in the state. The residential price of Utah's electricity increased 5% in 2022 to 11.0 cents per kWh, lower than the national average of 15.0 cents per kWh.

**Consumption.** After several years of near-steady demand (from about 2013 to 2019), electricity consumption resumed its upward trend in 2020, setting new record highs for three years in a row, reaching an estimated 33,100 GWh in 2022. These increases took place in the residential (accounting for 34% of total demand) and commercial (38% of total demand) sectors, whereas electricity demand in the industrial sector (27% of total) decreased slightly. Residential electricity consumption per person decreased from an average of 3.22 MWh per capita between 2006 and 2013 to 3.05 MWh between 2014 and 2019. This decrease was most likely related to increased energy efficiency measures as well as the increased use of residential PV solar. However, the COVID-19 pandemic seems to have spurred increased electricity usage in the residential sector (e.g., more work-from-home opportunities, etc.), resulting in an increase in per person electricity usage of 3.21 MWh in 2020, 3.28 MWh in 2021, and 3.32 MWh in 2022. Overall, Utah remains a net exporter of electricity, using only 84% of in-state electric generation.

## 2023 OUTLOOK

Although the past couple years were dominated by the impact of the COVID-19 pandemic on Utah's energy industry, 2022 returned to a "new normal" with a strong economy, surging energy demand, high energy prices, and the positives and negatives that go along with each. This situation is coupled with the intensifying interest in "the energy transition" with increasing emphasis on renewable and carbon-neutral energy sources, innovations in the hydrogen economy, and the electrification of the transportation system.

Oil prices in Utah will most likely remain volatile but relatively high in 2023, in the upper-\$60 to low-\$70 per barrel range as demand continues to grow and geopolitical situations influence global prices. Oil prices in this range will continue to support 8 to 10 drill rigs in the Uinta Basin, mostly drilling long-reach horizontal oil wells but with some continued vertical/directional development. However, in the short term, production (currently at record highs) will be curtailed by transportation constraints, supply-chain issues, labor issues, and gas off-take options. The game-changer for the Uinta Basin would be the construction of

the proposed Uinta Basin railway. All approvals from the federal government have been granted and construction could begin after financing has been secured. When built, the proposed railway could open new out-of-state markets for Utah's crude oil, creating potential for significantly higher crude oil production. Exploration/development elsewhere in Utah will likely remain minor compared with drilling in the Uinta Basin, but the increase in crude oil prices has spurred new interest in the Paradox Basin (e.g., Cane Creek play) and the Utah Central Thrust Belt. Demand for petroleum products in Utah is projected to hit record highs in 2022 and is expected to continue this upward trend into 2023 and beyond—any petroleum demand reductions predicted by the electrification of Utah's transportation sector will take years to materialize as electric vehicles still only account for 0.6% of total vehicle registrations.

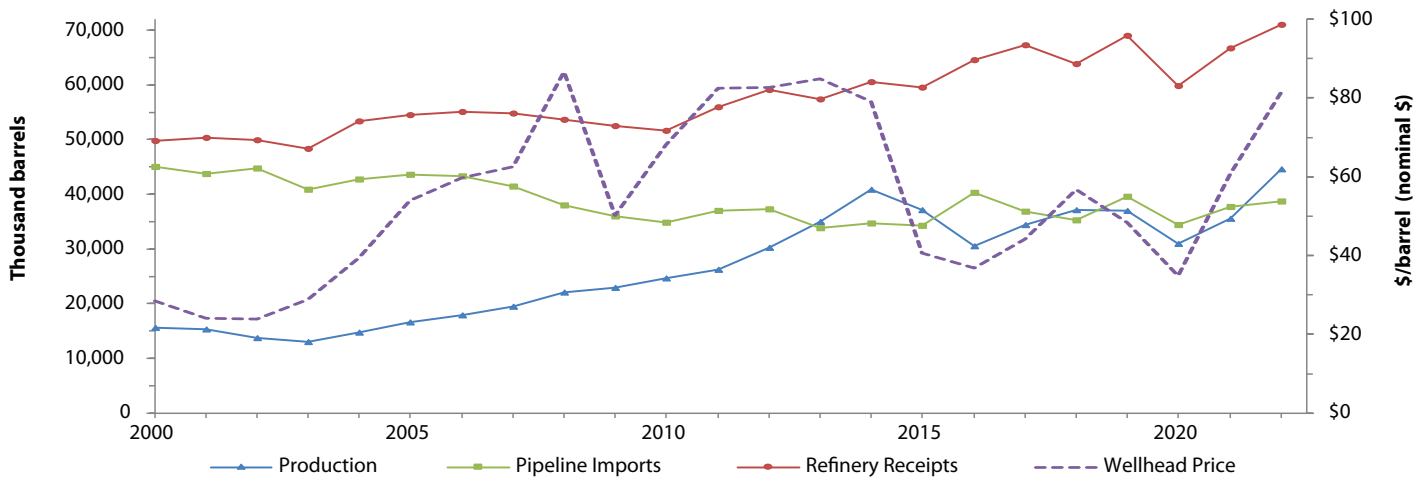

Several years of sub-\$3 per Mcf natural gas prices caused stagnation in Utah's natural gas production industry, resulting in the lowest production levels since the 1980s. However, in late 2021 and continuing into 2022, the price of natural gas increased to the \$5–\$8 per Mcf range. These higher prices have facilitated the return of drilling rigs that specifically target natural gas reservoirs, with three rigs drilling gas wells currently, all in the Uinta Basin. However, national benchmark prices for natural gas started dropping in January 2023 and are currently (end of February) back near \$2.50 per Mcf. Spot prices in the Rockies spiked in December 2022 and January 2023, averaging \$28 and \$16, respectively, but have also decreased back into the \$2–\$3 range. It is unclear how long these low prices might last (prices are predicted to be in the \$2 to \$3 range for the rest of 2023), but eventually, if they stay low, it will once again result in laid down drill rigs and falling production.

Coal production in Utah is expected to remain in the 11- to 13-million-ton per year range for the next few years, as in-state demand currently averages 11 to 12 million tons a year and out-

of-state demand continues to be less than 2 million tons per year. This current supply-demand balance will change starting in about 2025 when the coal-fired Intermountain Power Plant converts to natural gas and eventually hydrogen, removing demand for 3 to 4 million tons of coal. Utah coal deliveries to the foreign export market have experienced a modest jump in the past few years and potential remains for access to a strong overseas market which could partially replace falling domestic demand. However, West Coast port facilities are vital for accessing the Asian coal market, but current capacity at existing ports is limited and additional capacity could be a challenge to build.

Utah's electric generation portfolio will continue to evolve as demand for carbon-neutral electricity increases and several new utility-scale solar farms are installed in 2023 and beyond (an additional 600 MW of new capacity is under construction as of late 2022, with many more facilities in the planning stages). This intensified emphasis on carbon-neutral energy sources has spurred research and development into large-scale electric storage facilities (e.g., underground compressed air, pumped hydroelectric facilities, and more traditional utility-scale battery storage), enhanced geothermal systems at the Frontier Observatory for Research in Geothermal Energy (FORGE) site in central Utah as well as traditional geothermal resources, the production of carbon-neutral hydrogen for electricity generation or vehicle fuel, and next-generation nuclear energy facilities (e.g., molten salt, etc.). Consumption of electricity has resumed its faster-paced growth as our modern society becomes more reliant on electricity for everyday conveniences. Despite recent changes, Utah's well-established coal-fired power plants (which still provide 57% of Utah's electricity generation), as well as an established fleet of natural-gas plants and nearly 1.5 GW of solar capacity, will assure affordable, reliable electric power for the near future and keep Utah's electricity prices nearly 30% below the national average.

\*Production and price are estimated

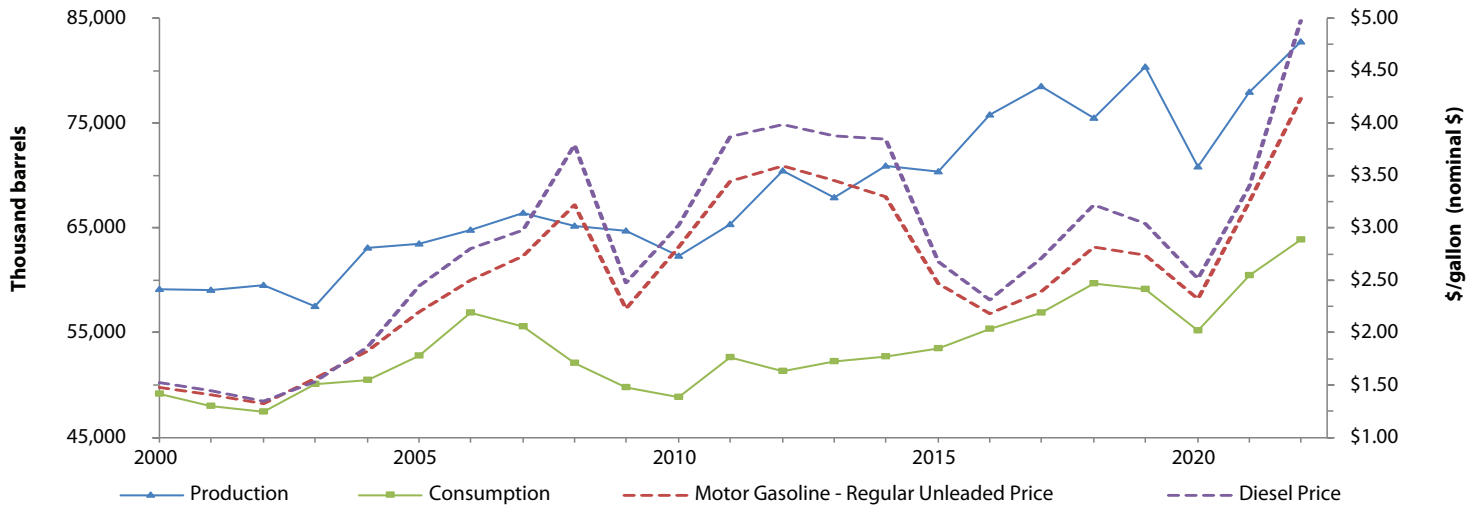

1. Out-of-state imports only include pipeline shipments; minor imports may arrive by truck, and additional minor imports may come from other states.

2. Estimated by subtracting refinery receipts from total supply; all crude oil imports are assumed to be accounted for.

Note: Prices and values are in nominal dollars.

\*Distillate, other, and total consumption was estimated.

\*\*Consumption was estimated

na = not available

1. Amounts shipped by truck are unknown.

2. The Pioneer pipeline, originating from Sinclair, Wyoming, is the only pipeline importing petroleum products into Utah.

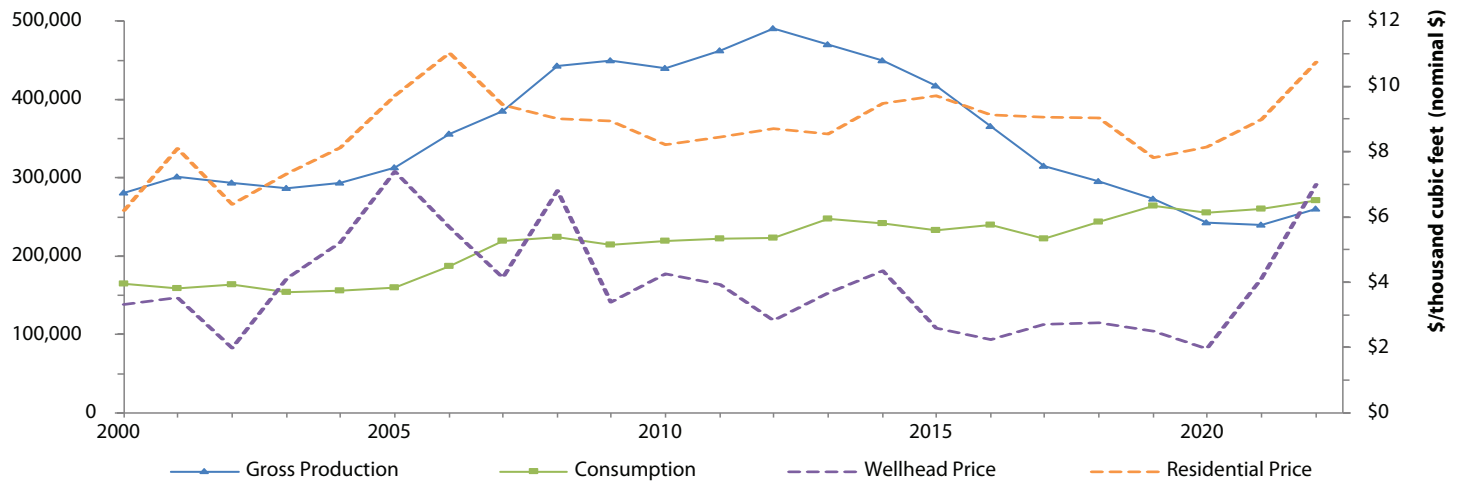

3. Prior to 2012, only the Chevron Petroleum pipeline exported product to the Northwest (Idaho and Washington); in 2013 this line was sold to Tesoro.

Starting in 2012, the UNEV pipeline started shipping product to the Las Vegas area; however, a minor amount of product is offloaded near Cedar City (amount estimated).

Note: Prices are in nominal dollars.

 Staker Parson Materials and Construction  
 Wells Fargo

## Kem C. Gardner Policy Institute Advisory Board

### Conveners

Michael O. Leavitt  
 Mitt Romney

### Board

Scott Anderson, Co-Chair  
 Gail Miller, Co-Chair  
 Doug Anderson  
 Deborah Bayle  
 Roger Boyer  
 Michelle Camacho  
 Wilford Clyde  
 Sophia M. DiCaro

Cameron Diehl  
 Lisa Eccles  
 Spencer P. Eccles  
 Christian Gardner  
 Kem C. Gardner  
 Kimberly Gardner  
 Natalie Gochnour  
 Brandy Grace  
 Rachel Hayes  
 Clark Ivory  
 Mike S. Leavitt  
 Derek Miller  
 Ann Millner

Sterling Nielsen  
 Jason Perry  
 Ray Pickup  
 Gary B. Porter  
 Taylor Randall  
 Jill Remington Love  
 Brad Rencher  
 Josh Romney  
 Charles W. Sorenson  
 James Lee Sorenson  
 Vicki Varela

### Ex Officio (invited)

Governor Spencer Cox  
 Speaker Brad Wilson  
 Senate President  
 Stuart Adams  
 Representative Brian King  
 Senator Karen Mayne  
 Mayor Jenny Wilson  
 Mayor Erin Mendenhall

## Kem C. Gardner Policy Institute Staff and Advisors

### Leadership Team

Natalie Gochnour, Associate Dean and Director  
 Jennifer Robinson, Chief of Staff
