Utah's Increasing Diversity: Population Projections by Race/Ethnicity

ANALYSIS IN BRIEF

Utah will continue to be a place of economic and educational opportunity, bringing new residents from domestic and international regions. We project Utah's population will continue to grow and become more diverse along many dimensions, including ethnicity and race. The trend toward increasingly diverse schools and workplaces will continue. This future is an outgrowth of Utah's strong growth dynamic and increasing global economic and cultural interconnections. Along with the rest of the U.S., Utah's population will continue to age. We project that this will be the case for all race and ethnic groups as death and birth rates decrease. Whites will on average be older, and other groups, especially multi-race Utahns, younger. Preparing for this future will help Utah benefit from an increasingly diverse and talented population.

We project that the share of Utah's minority population will increase from approximately 20 percent in 2015 to 35 percent in 2065. Half of Utah's population growth from 2015 to 2065 will come from minority populations. Among minority populations, Hispanics show the largest numerical increase with approximately 850,000 new Utah residents from 2015 to 2065, reaching 1.3 million. Those identifying as Two or More Races are the fastest growing group, with an average annual percentage growth rate of 8.1 percent. These demographic trends are part of a larger generational shift as youth become more diverse compared to their elders. The Utah population will continue its trend towards more diversity while maintaining a smaller share of minority groups compared to the nation.

Overview

Utah's population continues to diversify racially and ethnically. These new demographic projections explore Utah's future racial and ethnic composition, the impacts on population growth, and changing age distributions over the next 50 years. Economic expansion and intensifying global interconnections drive and reinforce these demographic dynamics as more people move to the United States and Utah. Over time, migration will more dependably contribute to population increase as people move to Utah for economic, educational, and recreational opportunities. New Utahns, regardless of origin, contribute to the state's growth, youthfulness, and cultural diversity.

This analysis builds on the state baseline series and includes annual July 1 projections of resident population by race and ethnicity, single-year of age, and sex through 2065.

Results

How Do We Measure Race and Ethnicity?

There are many dimensions to demographic diversity, such as nativity and language, but this analysis focuses solely on official administrative categories of race and ethnicity. The U.S. Office of Management and Budget (OMB) creates race and ethnic designations, and those definitions guide Census Bureau research, including U.S. population estimates and projections. We utilized the same conventional seven-group race and ethnic categorizations for ease of continuity and comparison. Individuals claiming Hispanic, Latino, or Spanish origin are categorized as Hispanic. Non-Hispanic persons can be

classified as a single race alone—White, Black or African American, American Indian or Alaska Native, Asian, Native Hawaiian or Pacific Islander—or as two or more races. For easier reading, the narrative, tables, and figures in this brief omit the qualifiers “non-Hispanic” and “alone.” For example, “Two or more races” means “non-Hispanic two or more races”, and “Asian” means “non-Hispanic Asian alone.”

Also, persons identifying as Hispanic, any non-White race, or two or more races are classified “minority.” Those identifying as White are classified “majority.” For more detail on the racial and ethnic categories, see “What Are Race and Ethnicity?” in the Methodology section.

Race/Ethnicity Categories

These projections use seven non-overlapping categories of race and ethnicity.

- Non-Hispanic
 - Single-Race
 - White
 - Black or African American
 - American Indian or Alaska Native
 - Asian
 - Native Hawaiian or Pacific Islander
 - Two or more races
- Hispanic

Top-level results indicate Utah will continue its past trend of racial and ethnic diversification. Utah's minority population will increase its share of the total population from approximately 20 percent in 2015 to 35 percent in 2065. Half of the total population growth from 2015 to 2065 will come from minority populations. Among minority populations, Hispanics show the largest numerical increase with approximately 850,000 new Utah residents from 2015 to 2065, reaching 1.3 million. Those identifying as Two or More Races are the fastest growing group, increasing five-fold from about 60,000 in 2015 to 300,000 in 2065. These demographic trends are part of a larger generational shift as youth become more diverse compared to their elders. Results indicate that the Utah population will continue its trend towards more diversity while maintaining a smaller share of minority groups compared to the nation.

How Will Minorities Contribute to Utah's Population Growth?

We project the total Utah population will increase by about 2.8 million between 2015 and 2065. Utah's ethnic minority populations will contribute half of that population increase, increasing from one in five Utahns in 2010 to just over one in three by 2060.

The U.S Census Bureau projections attribute nearly all of the national population growth to minorities between 2010 and 2060. Nationally, minority shares will increase from just over one in three to nearly two in three. This means that Utah's projected share of minority population in 2060 will be close to the 2010 national share (see Figure 1).

Figure 1. Share of Minority Population for Utah and The U.S., 2010 and 2060

Note: Majority includes those identifying as non-Hispanic White Alone, and Minority all others.

The Gardner Institute gratefully acknowledges the financial support for this research to produce race and ethnic projections for Utah higher education planning by the Harris H. and Amanda P. Simmons Foundation.

Figure 2. Minority Share of Population, Utah and U.S., 1900-2060

Note: Minority includes those identifying as something other than Non-Hispanic White Alone. Source: U.S. Census Bureau; Perlich 2002; Kem C. Gardner Policy Institute

Figure 2 compares Utah and national historic and projected minority shares of the population. Utah’s minority makeup has been consistently lower than the U.S. average, but consistently parallels and trends in the same direction. Utah’s changing racial and ethnic composition corresponds to historical patterns of immigration.¹ Through the early twentieth century, nearly all immigrants arrived from Europe. Immigration slowed in the middle of the century, but has again become a substantial contributor to Utah’s robust population and economic growth, especially since 1990. These new immigrants are of multiple origins and predominantly racial and ethnic minorities. They and their children greatly contribute to a new Utah.²

Demographic Patterns by Race/Ethnicity Group

Comparing minorities and the White population only tells part of Utah’s story. Each racial and ethnic category shows different trends of growth into the future. Table 2 (Appendix) details the past and future population totals for each group, and Figure 3 compares population totals in 2015 and 2065.

Figure 3. Utah Population by Race/Ethnicity: 2015 and 2065*

* Individuals claiming Hispanic, Latino, or Spanish origin are categorized as Hispanic and can be of any race. Non-Hispanic persons can be classified as a single race alone—White, Black or African American, American Indian or Alaska Native, Asian, Native Hawaiian or Pacific Islander—or as two or more races. Source: Kem C. Gardner Policy Institute

Projected Counts and Shares

We project 3.8 million Utahns identifying as White in 2065, an increase from an estimated 2.4 million in 2015. Hispanics are the next largest population group, comprising approximately 400,000 in 2015. We project the Hispanic population to number 1.3 million in 2065, surpassing one million by 2050. The population is not only becoming less White, but also

increasingly multi-racial. Our projections reveal the population identifying as Two or More Races is expected to grow rapidly, increasing five-fold to nearly 300,000 in 2065. This is the highest growth rate of the seven groups. People who identify as multi-racial are often younger, resulting in more births within this mixed heritage population in the near future.

Figure 4. Utah Population Shares by Race/Ethnicity: 2015 and 2065*

* Individuals claiming Hispanic, Latino, or Spanish origin are categorized as Hispanic and can be of any race. Non-Hispanic persons can be classified as a single race alone—White, Black or African American, American Indian or Alaska Native, Asian, Native Hawaiian or Pacific Islander—or as two or more races.
Source: Kem C. Gardner Policy Institute

We can look at present and projected racial shares of the total population to get a better sense of each group’s growth trajectory. Figure 4 shows each group’s share of the total population for 2015 and 2065. Whites decrease from 79 percent of the population to 65 percent, while Hispanics increase from 14 to 22 percent. The Two or More Races category becomes the third largest racial group by 2065, increasing from two to five percent of the population. Most minority groups increase their shares of the total population, but two categories see minimal to no change over the projection period: American Indian or Alaska Native, and Native Hawaiian or Pacific Islander.

How Does Immigration Contribute to Utah’s Diversity?

In the early 2000s, most international immigration to the U.S. was from Latin America and of Hispanic origin—but that trend has slowed since the Great Recession, with increasing Asian immigration. In 2015, there were about 70,000 Utahns identifying as Asian. We project them to number over 200,000 by 2065. Utah’s Black or African American population share is considerably lower than the U.S. average, but we still expect the population to increase from 30,000 to 120,000—four times in size. The Census Bureau projects immigration from sub-Saharan Africa to increase considerably in the latter half of the twentieth century.³ These shifts in immigrant origins are primarily a product of robust population growth in Asia and sub-Saharan Africa.⁴

Prior to the arrival of immigrants of European origin, Utah’s population consisted of American Indians (using current classifications). We project this population will grow by about 20,000 over 50 years to reach 50,000. The American Indian or Alaska Native population tends to have its population count diluted by administrative redefinition.⁵ This is especially true in urban areas. We explain these administrative classification rules in more detail in the Methodology section. Similarly, individuals identifying as Native Hawaiian or Pacific Islander are more likely to classify as multiple-race or mixed heritage. This population is more highly concentrated in Utah relative to the U.S. average, and is projected to grow from about 30,000 to 70,000.

Racial and Ethnic Composition by Age

The population is aging across all racial categories, consistent with national and international trends. However, differing birth and death rates between racial groups contribute to generally different age compositions.

We overlaid the 2010 population by age and sex onto the 2065 population to reveal how each race and ethnicity is growing, changing, and aging (Figures 5 and 6). The pyramid for Whites in 2065 is nearly rectangular, evidence of an aging population and lower fertility. In comparison, the pyramid for Two or More Races maintains the triangular signature characteristic of younger and faster-growing populations.

The Asian population maintains a thin base with fewer children, a large share of the college-age population, and a gradual aging of its adult population. These trends are consistent with our knowledge of Asian fertility and immigration into Utah for both college and employment.

Racial and Ethnic Population Growth by Age Group

The generational differences in racial minority growth are evident if we break down the population growth by age groups. We examine the racial/ethnic share of population growth for five key age groups: preschool age (0-4), school age (5-17), college age (18-24), working age (18-64), and retirement age (65 and older). Table 3 (Appendix) contains detailed race and ethnicity population counts for these age groups in select years.

Figure 7 shows contributions to projected population growth by age groups. We again see the clear trend of Whites aging as well as the increasing share of younger Utahns identifying as racial and ethnic minorities.

The projected White population will comprise nearly three-fourths of growth for the retirement age population, but only about one-quarter for the preschool and school age populations. In contrast, among Utah preschool and school age populations, we project almost half of the growth to be from individuals identifying as Hispanic. For these same young age groups, about 20 percent of the projected growth is from those classifying as multi-racial, reflecting our changing society.

Figure 5. Utah Population Pyramids, 2010 and 2065, Select Race/Ethnic Groups*

All Groups

Black or African American

American Indian or Alaska Native

 2065 Female

* Individuals claiming Hispanic, Latino, or Spanish origin are categorized as Hispanic and can be of any race. Non-Hispanic persons can be classified as a single race alone—White, Black or African American, American Indian or Alaska Native, Asian, Native Hawaiian or Pacific Islander—or as two or more races.
Source: Kem C. Gardner Policy Institute

We project growth in Utah’s college age population to be less diverse than the school age population—about one-third White and 40 percent Hispanic. The distribution of projected growth in the working age population is more similar to growth for the total population, partially because those age groups are such a large portion of Utah’s current and projected population. Utah’s future workforce, like the U.S., will continue to become more racially and ethnically diverse, with international immigration as a major driver.

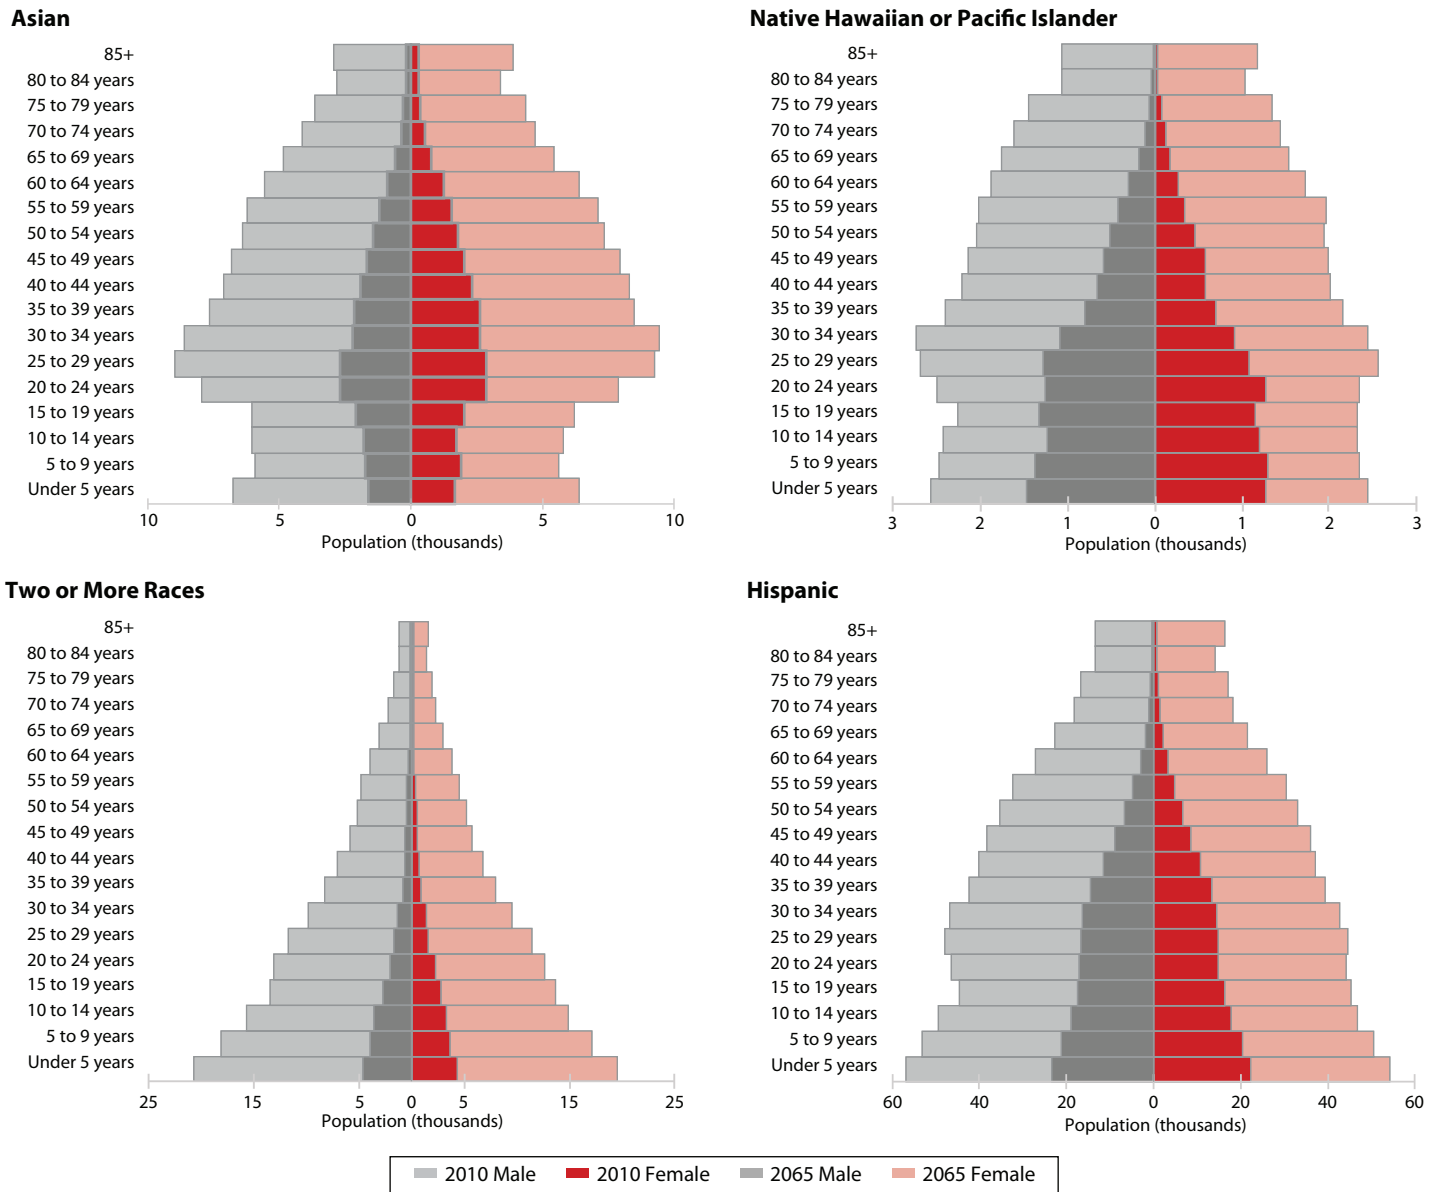

Everyone Ages as Multi-Race Populations Remain the Youngest

Age profiles vary considerably for these seven groups, and are closely related to fertility rates. Each race and ethnic group

becomes older largely due to decreasing death and birth rates, but the extent of aging varies. From 2015 to 2065, the total population median age increases by 7.6 years, with the smallest increase in the Asian group (6.5 years) and the largest increase in the Native Hawaiian or Pacific Islander group (10.2 years).

In 2065, we project Whites will be the oldest group, followed by Asians. The youngest population, by far, are those reporting Two or More Races, consistent with recent cultural and generational shifts. In 2010, Asian Utahns had the highest median age at 32 years, but recently dropped below the White group. This is due to an influx of college and young working age Asian migrants. Figure 8 and Table 4 (Appendix) show median age data by race over time.

Figure 6. Utah Population Pyramids, 2010 and 2065, Select Race/Ethnic Groups*

* Individuals claiming Hispanic, Latino, or Spanish origin are categorized as Hispanic and can be of any race. Non-Hispanic persons can be classified as a single race alone—White, Black or African American, American Indian or Alaska Native, Asian, Native Hawaiian or Pacific Islander—or as two or more races.
Source: Kem C. Gardner Policy Institute

Our projections show that trends in median age are inversely related to those of fertility rates. Figure 9 demonstrates how lower U.S. fertility rates in 2017 correlate with higher projected Utah median ages in 2065. Migration is a complicating factor, but there is clearly an inverse relationship. We utilize the 2017 U.S. total fertility rate (TFR) data, since Utah TFR estimates are uncertain for the smaller race groups.

Generational Shifts

Millennials and even younger Americans are more likely to identify as multi-racial and ethnic than older generations. Baby Boomers, born during a period with low immigration levels, are aging rapidly. Consequently, Utah’s future generations will

be even more diverse. Minority populations are concentrated in the younger preschool, school, and college age groups, and White populations are more concentrated in the retirement age groups (Figure 10).

These generational shifts are occurring nationally as well. We project the race and ethnic makeup of the Utah population will become more diverse over time but lag behind the nation by about two generations. Utah’s 2060 minority age signatures, shown in Figure 10, will be roughly similar to those of the U.S. in 2010. Utah minorities comprised about one-fifth of children under age five in 2010, but by 2060 could be nearly half. For the population aged 85 and older, minorities grow from under 10 percent to about 20 percent.

What Do These Results Mean for Utah?

Utah will continue to be a place of economic and educational opportunity, bringing new residents from domestic and international regions. We project Utah’s population will continue to grow and become more diverse along many dimensions, including ethnicity and race. The trend toward increasingly diverse schools and workplaces will continue. This future is an outgrowth of Utah’s strong growth dynamic and increasing global economic and cultural interconnections.

Along with the rest of the U.S., Utah’s population will continue to age. We project that this will be the case for all race and ethnic groups as death and birth rates decrease. Whites will on average be older; and other groups, especially multi-race Utahns, younger. Preparing for this future should help Utah benefit from an increasingly diverse and talented population.

This is the first time Utah has had such detailed projections that are consistent with the state baseline. These projections

add considerable value to our previously released Utah State and County Demographic and Economic projections. See the Methodology section below for more detailed information on the projection methods, data, and definitions.

Table 1. Percent of Age Group Identifying as Minority, 2015 and 2065

Age Group	2015	2065	Age Group	2015	2065
Preschool	26.4%	44.7%	Working	20.5%	35.7%
School	24.8%	41.7%	Retirement	9.0%	23.3%
College	24.2%	40.5%	All Ages	20.8%	34.8%

Note: Minority includes those identifying as something other than Non-Hispanic White Alone.
 Age groups: Preschool (0-4 years); School (5-17 years); College (18-24 years); Working (18-64 years); Retirement (65 and older)
 Source: Kem C. Gardner Policy Institute

Methodology

This section provides a brief overview of the data and modeling procedures we used to generate these projections. We encourage interested readers to contact us with additional methodology questions.

Data

We utilized four main data sources in this work:

1. Census Bureau 2010-2017 single year of age sex and race postcensal population estimates.⁶
2. Census Bureau five year of age sex and race intercensal population estimates.⁷
3. Utah Demographic and Economic Model Baseline 2017 Utah single year of age and sex population projections.^{8,9}

4. Census Bureau 2017 U.S. population projections.¹⁰

Procedure

We based our projections on the previously published Utah baseline population projections, and distributed those population totals among the seven new groups. Using statistical models, we related Utah’s patterns to U.S. patterns in two main steps:

1. We projected the proportion of Utah’s annual total population in each race-ethnicity group.
2. We projected the annual age-sex distribution for each race-ethnic group, conditioned upon the projected Utah race-ethnic distribution and joint age-sex distribution.

Uncertainty

This baseline population projection represents a “most likely” scenario based on current data and trends. We recognize the uncertainty of future projections.

Some sources of uncertainty include:

- Random uncertainty, including statistical “noise”.
- Errors in the input data.
- Modeling uncertainty such as incorrect assumptions and the detail lost by using mathematical equations to represent social phenomena.
- The future differs from the past. For example, measurement categories for race and ethnicity will probably change again. Changes in migration policy and international conditions are likewise unpredictable.

What are Race and Ethnicity?

Some version of “race” has been part of the U.S. Census since 1790. In earlier years, “race” referred to skin color and U.S. census takers assigned each person a race based upon their personal observations. In the modern Census, race is self-reported. This change is consistent with scientific findings that show no biological basis for racist theories and a growing recognition that race assignment was often used to restrict certain groups’ rights.¹¹ “Ethnicity” is usually distinguished from race by a focus on shared culture or heritage—a way of “living” more than “being.” While there are hundreds of ethnicities within our nation of immigrant ancestors, federal agencies currently only recognize one ethnicity: Hispanic. Both race and ethnic identification have clear social, economic, and policy implications. For these reasons, many groups (public and private) desire population projections by race and ethnicity.

What are the Current Government Definitions for Race and Ethnicity?

There is no one correct way to categorize race or ethnicity. Categorization rules have changed for nearly every decennial

census in U.S. history, highlighting that race and ethnicity are social concepts unique to historical time and place. The White House Office of Management and Budget uses race and ethnic designations to inform public policy, and those definitions guide much Census Bureau research,¹² including U.S. population projections. We utilized the same conventional categorization.¹³

Current definitions include five race groups (White, Black or African American, American Indian or Alaska Native, Asian, Native Hawaiian or Pacific Islander) and one ethnicity (Hispanic). These are categorized into the seven exhaustive and mutually exclusive groups outlined in the box below.

The classification procedure consists of three steps.

1. If the person reports being of Hispanic origin, they are classified as Hispanic; regardless of racial identification.
2. Of those not classifying as Hispanic, those that classify as two or more of the five race groups are designated Non-Hispanic Two or More Races.
3. Those not classifying as Hispanic, and classifying as only one race, are assigned the corresponding race category, with the qualifier “alone.”

Race/Ethnicity Categories

- Non-Hispanic
 - Single-Race
 - White
 - Black or African American
 - American Indian or Alaska Native
 - Asian
 - Native Hawaiian or Pacific Islander
 - Two or more races
- Hispanic

Minority and Majority

Recently, the Non-Hispanic White Alone group has dominated the U.S. population. Many researchers, scholars, journalists, and planners have adopted an expository dichotomy to represent diversifying populations. Group 1, or “Majority”, is non-Hispanic White Alone, and all other race and ethnic classifications are lumped into Group 2, or “Minority”. We utilize that same concept in this brief.

* Individuals claiming Hispanic, Latino, or Spanish origin are categorized as Hispanic and can be of any race. Non-Hispanic persons can be classified as a single race alone—White, Black or African American, American Indian or Alaska Native, Asian, Native Hawaiian or Pacific Islander—or as two or more races.
